The Kentucky Trauma Advisory Committee (KyTAC) wishes to acknowledge that we have liberally used the excellent work of the Minnesota Trauma System for inspiration. Many of our own thoughts and planning seemed to parallel work that Minnesota had already done well.

So, building on the success of those who went before us, we freely admit that we have borrowed liberally from their excellent talents to create the starting point for our new trauma care system.

This manual contains a description of the designation process as well as examples of sample policies and forms to help you develop your hospital's trauma program.

Trauma Hospital Designation

Verification vs. Designation

For years Kentucky had Level I trauma centers located in the population-dense areas of Louisville and Lexington, and in the rural areas of Campbellsville and Madisonville. These hospitals were evaluated by the American College of Surgeons (ACS) Committee on Trauma (also referred to as ACS COT) which verified that they met at least the minimum criteria for a trauma center established by the ACS.

In 2008 the Kentucky General Assembly passed a bill authorizing the Commissioner of Health, Kentucky Department for Public Health (KDPH), to develop a statewide trauma care system, including a process to designate hospitals as trauma centers. The law also created a Kentucky Trauma Advisory Committee (KyTAC) to work with and assist the commissioner with the development of the system. References to law can be found in Attachment AA of this manual.

The law did not specify how the system was to be configured, but the KyTAC advised the commissioner to use the ACS COT Level I, II and III standards, and has developed a set of verification criteria and processes for Level IV based on guidance in the ACS COT reference, "Resources for Optimal Care of the Injured Patient".

The term "designation" is an official label assigned by a political authority. Hospitals in Kentucky can *volunteer* to become part of the trauma care system and submit for state designation as a trauma center at a specific level of capability. Designated trauma centers in Kentucky must demonstrate that they meet the state's recognized criteria for a trauma hospital. The standards and process are spelled out in 902 KAR Chapter 28. Designation is for a defined period of time, and must be periodically re-verified to maintain that level of designation.

The term "verification" is a process of reviewing the hospital and its trauma program against established criteria. As noted above, for Levels I-III Kentucky currently recognizes the ACS COT standards and verification process. For Level IV, Kentucky has developed its own standards and verification process, based upon ACS guidance and the recommendations of the KyTAC. Hospitals must be **verified** as having met Kentucky's recognized standards and criteria before they can be designated at a specific level.

Level I, II and III Designation Process

The designation process in Kentucky is a voluntary program for hospitals. The KDPH currently accepts ACS level I, II or III verification as adequate evidence that a hospital meets the standards for the appropriate level.

The ACS requires a hospital which is anticipating a request for verification as a Level I, II or III trauma center to have a working, documentable trauma program in place. This will include such things as the designated personnel, training, an effective quality improvement program, educational outreach and about a year's data to document that a functioning system is in place and working effectively. *The verification process also now includes meeting the requirements for "Pediatric Readiness in the Emergency Department" (A joint policy statement of the American Academy of Pediatrics, the American College of Emergency Physicians, and the Emergency Nurses Association is available at: [https://www.annemergmed.com/article/S0196-0644\(18\)31167-3/pdf](https://www.annemergmed.com/article/S0196-0644(18)31167-3/pdf))*

Since the developing Level I, II or III facility most likely will have a working trauma program, KDPH and the Kentucky Trauma Advisory Committee would like to be aware of the evolving trauma center to track its progress and assist as necessary. To that end, the hospital can start the voluntary trauma center designation process in Kentucky by submitting a letter of intent to the Commissioner, Kentucky Department for Public Health as they begin work to prepare for an anticipated ACS-COT verification site visit. [Note that ACS COT typically requires a solid year's data and PI work, plus documented completion of all their required staff education, prior to verification.] The letter to KDPH should identify the trauma care system team with contact information, their initial trauma center development plan, and the anticipated timeline for the ACS verification site visit. It should project when the facility will be able to start reporting its trauma data to the Kentucky Trauma Registry using software meeting the requirements of the 902 KAR Chapter 28. **[Note that Trauma Regulation 902 KAR 28:020 asks that a representative from the Kentucky Department of Health or the KY Trauma Advisory Committee participate as an observer during an ACS COT site visit since are going to use their verification finds for Kentucky Trauma System Designation.]**

When the hospital completes the ACS verification process, the facility will then complete the Request for Trauma Center Designation Application as a Level I, II or III trauma center in Kentucky using the application that can be downloaded from the Kentucky Trauma Care System website. A copy of the ACS Certificate of Verification, and a copy of the verification report, will be attached to and become part of the application package.

The KyTAC will review the application package and will make recommendations to the commissioner about the potential designation of the facility as a *Trauma Center* in the Commonwealth of Kentucky. The length of time the Kentucky Trauma Center designation is valid is tied directly to the expiration period for the ACS verification. Re-verification will require the facility to apply for re-designation.

If a trauma hospital experiences a change in its ability to meet the minimum required criteria at any time during the designation period, it must notify the commissioner, and subsequently the KyTAC, immediately. This element is critical to the effectiveness of the statewide trauma program because it may require other regional hospitals and local EMS providers to adjust their operating guidelines.

Level IV Designation Process

The Kentucky Trauma Care System has developed its own criteria and standards for Level IV verification and designation that will be discussed further in this manual. Level IV "Criteria for State Verification" is in [Attachment X](#). [Note that ACS does not currently have verification criteria and processes in place beyond Level III, even though its guidance discusses the concept of system development beyond Level III.]

The Level-IV verification process in Kentucky also includes meeting the requirements for "Pediatric Readiness in the Emergency Department". A checklist is available in [Attachment X](#). (A joint policy statement of the American Academy of Pediatrics, the American College of Emergency Physicians, and the Emergency Nurses Association is available at: [https://www.annemergmed.com/article/S0196-0644\(18\)31167-3/pdf](https://www.annemergmed.com/article/S0196-0644(18)31167-3/pdf))

As with Levels I-III, the designation of Level IV trauma facilities in Kentucky is voluntary. KDPH empowers the Kentucky Trauma Advisory Committee to *verify* the presence of the resources and processes required and published in Kentucky Administrative Regulations. Once successfully verified, KyTAC will recommend to the commissioner that the facility is prepared to

be recognized and designated as a Level IV *Kentucky Trauma Center*. The length of time that the designation is valid is tied directly to the expiration period for the verification. Re-verification will be required to apply for re-designation.

The hospital shall begin the process by first submitting a letter of intent to the Commissioner, Kentucky Department for Public Health in advance of an anticipated verification site visit. The letter should identify their trauma care system team with contact information, their initial trauma center development plan, and the anticipated timeline for the verification site visit. It should project when the facility will be able to start reporting its trauma data to the Kentucky Trauma Registry using software meeting the requirements of 902 KAR Chapter 28. At least one year's data should be on file in the registry before a site visit is conducted.

When it appears that the key elements are in place, and the hospital feels it is ready, the hospital can either request a consultation visit, or can make application for a verification site visit and designation. **In either case, the costs for the team to perform this visit will be borne by the requesting facility.** The application will spell out required attachments, which will include (but may not be limited to) copies of the facility's Board Resolutions, trauma linkage agreements and trauma protocols as outlined in this manual. The application can be downloaded from the Kentucky Trauma Care System website.

Once complete, a copy of the verification site visit report, based on the "Criteria for State Verification" in [Attachment Y](#), will be attached to and becomes part of the application. The KyTAC will review the complete application package and will make recommendations to the commissioner about potential designation as a *Level IV Trauma Center* in the Commonwealth of Kentucky. The length of time the *Kentucky Trauma Center* designation is valid is tied directly to the expiration period for the verification. Re-verification will be required to apply for re-designation.

Level IV Consultation/Verification Program

The KyTAC Consultation/Verification Program is designed to assist hospitals in the evaluation and improvement of trauma care. This is accomplished by an on-site review of the hospital by a peer review team authorized by the commissioner who has no conflict of interest with the hospital being verified, such as being on the medical staff or having a contract with the hospital or hospital system, and are experienced in the field of trauma care and trauma care system development. The team assesses commitment, readiness, resources, policies, patient care, protocols, performance improvement, and other relevant features as outlined in this manual.

Consultation: The KyTAC can provide a consultation visit to the requesting entity if requested. The consultation visit is performed to assess the entity's system of trauma care delivery or prepare for a verification review. The consultation visit is performed by a two-member team, one of which will be a physician and one will be a member of the KyTAC. The consultation visit will follow the same format as a verification review. The consultation visit will provide recommendations to aid the facility in attaining verification. A copy of the consultation visit report will be provided on an informational basis to the Verification Committee of the KyTAC. A consultation visit is not required prior to verification. Costs associated with a consultation visit are borne by the requesting facility.

Verification: Trauma center verification is the process by which the KyTAC confirms the hospital is performing as a trauma center according to the state's required criteria. A verification site visit is performed at the request of the facility. The verification process is typically performed by a two-person team authorized by the Commissioner. The verification visit results

in a report to the full KyTAC outlining the findings and, if successful, recommendation that a Certificate of Verification be issued. A Certificate of Verification is valid for the period specified in 902 KAR Chapter 28. Once a site verification process is successfully completed a re-verification visit can be requested thereafter. Costs associated with a verification site visit are borne by the requesting facility.

Re-verification: A facility that has previously been verified is eligible for re-verification if the facility applies for and schedules its visit prior to the expiration of the current certificate. If the facility does not schedule its re-verification visit to occur prior to the expiration there may be a lapse. If that lapse is over twelve (12) months KyTAC may recommend that the facility submit a new verification application.

Focus Review: If, during the verification or re-verification review, a hospital is found to have criteria deficiencies which at the discretion of the KyTAC are felt to be isolated and correctable, an on-site focus review may be necessary. In this case, another two-member team returns to the facility. The returning team usually consists of at least one original review member. The hospital must demonstrate that they have corrected the deficiencies before a certificate can be issued. This process is to be conducted within six (6) months and not more than one (1) year from the time of notification of the results of the initial review. The certificate of verification will be dated from the initial verification/re-verification visit. The costs for the team to perform this visit will be borne by the requesting facility.

If, on the other hand, the breadth and/or depth of deficiencies are extensive, the facility will generally not be eligible for a focused review. Rather, the facility can be denied verification, and will likely be required to apply for a new consultation or verification review when deficiencies are corrected. As with the original reviews, the costs for the teams to perform these visits will be borne by the requesting facility.

Re-designation: As noted above, *Kentucky Trauma Center* designations are valid for no more than the time period specified in 902 KAR Chapter 28. Trauma Centers should apply for re-designation at least three months before their expiration date. An existing designation may be provisionally extended up to 18 months if the hospital applied for re-designation in a timely manner and is either scheduled for a site visit, awaiting the results of the visit or responding to deficiencies identified during the visit.

The re-designation site visits will typically focus on three areas: 1) compliance with the current designation criteria; 2) progress made toward strengthening the weaknesses identified during prior site visits; and 3) identifying how the system can collaboratively support the ongoing and future needs of the hospital's trauma care commitment. Specific suggestions for improvement will generally have an educational focus. The re-designation site visits are intended to be constructive, not punitive.

Hospital Organization

Before becoming designated, a formal trauma program must be established within the hospital. In addition to developing policies and protocols that address trauma team deployment, emergent transfers and performance improvement, the hospital board and medical staff must demonstrate a commitment to providing trauma care commensurate with the standards published by KyTAC and KDPH. Support for a hospital's participation in the statewide trauma care system is demonstrated when both the board of directors and the medical staff resolve to provide the resources necessary to attain and sustain designation. ([See Attachment A: Sample Hospital Board Resolution](#) and [Attachment B: Sample Medical Staff Resolution](#).)

The hospital's trauma program will require both a trauma services medical director/advisor which is a physician who will provide clinical oversight for the program and a trauma program manager/coordinator which is usually a nurse who will be responsible for the administrative functions of the trauma program. ([See Attachment C: Sample Trauma Services Medical Director Job Description](#) and [Attachment D: Sample Trauma Program Manager/Coordinator Job Description](#).)

The trauma program must be integrated into the hospital's organizational structure, appearing on the organizational chart. The position of the trauma program should be such that the trauma services medical director and trauma program manager/coordinator have sufficient authority to effect change across several departments. ([See Attachment E: Suggested Position of Trauma Program](#).)

Trauma Team Activation

A clear procedure for assembling the team that will provide immediate resuscitation to the seriously injured patient is vital to the efficient functioning of a trauma hospital. This procedure should specify when the team must be assembled, who is to respond and how they are to be notified. The policy should build upon existing facility-specific internal operating procedures, staffing resources and established state minimum criteria. (See [Attachment F: Sample Single-Tier Trauma Team Activation Protocol](#) and [Attachment G: Sample Multi-Tier Trauma Team Activation Protocol](#).)

Documentation of the patient's resuscitation can be easily accomplished with the use of a trauma flow sheet. A comprehensive flow sheet can also be used to easily identify data elements in the patient's chart required for trauma, and Traumatic Brain Injury (TBI) and Spinal Cord Injury (SCI) reporting (through the registry) or for performance improvement (PI) activities. (See [Attachment I: Trauma Resuscitation Record](#). [Registry, TBI/SCI and PI elements are shaded to help facilitate data abstraction.]

Hospitals must work with their emergency medical services (EMS) provider(s) to establish and train with protocols designed to quickly identify seriously injured patients and route them directly to appropriate trauma center. It is expected that the hospital trauma team will be activated upon notice by EMS. It is up to the individual hospital to determine if EMS personnel will activate the team or if EMS consults with the emergency department provider, who will then establish the need for activation. Continued work with the EMS professionals in your area will help to control over and under triaging.

Transfers

A well-functioning trauma care system is able to not only treat seriously injured trauma patients effectively and efficiently, but it is able to recognize the need to transfer patients to the trauma hospital that can best provide the resources that patient needs in a timely manner. To this end, level I, II, III and IV designations do not reflect the quality of care provided in those hospitals, but rather the resources available. Improved outcomes are closely associated with the time it takes for a facility to determine the need for and to accomplish the transfer.

The trauma center must establish procedures that direct the process for quickly and efficiently transferring a trauma patient to definitive care. Policy elements include anatomical and physiological criteria that if met, will immediately initiate transfer. (See [Attachment J: Suggested Criteria for Consideration of Transfer](#) and [Attachment M: Sample Trauma Transfer Protocol](#).) Simple algorithmic protocols can be found in [Attachment K](#) and [Attachment L](#).

Ambulance service personnel, with the guidance of medical direction and in cooperation with their local hospitals, may establish a process to request aero medical transport to meet them at the emergency department. The establishment of a close working relationship with local EMS providers will contribute to the development of an efficient transfer process.

Transfer agreements must be established and maintained with appropriate facilities capable of caring for patients with major trauma, severe burns and acute spinal cord injuries. An agreement with a second burn facility must also be maintained. (See [Attachment N: Transfer Agreement Examples](#).) A receiving trauma center may provide the transfer agreement for the referring hospital.

Performance Improvement

Every *Kentucky Trauma Center* hospital is expected to measure, evaluate and improve its performance with respect to numerous objectives in health care from patient care standards to fiscal solvency to materials management. A successful performance improvement process is designed to identify weaknesses within an organization that prevent the organization from providing the optimal care it is capable of providing.

The process used to facilitate performance improvement may be referred to by other names, such as quality assurance or continuous quality improvement. Regardless of by what means your facility employs, it is important that there be a process in place to provide an intentional process, or loop, to continuously identify shortcomings in patient care, determine the likely cause, employ a plan to correct it, then evaluate whether or not the shortcoming has been resolved, thus “closing the loop.” A PI program will assist your facility to constantly improve itself by identifying and confronting problems within the institution. The process can be applied to virtually any element of performance within the hospital.

PI Structure

While the required PI components must be in place in a trauma hospital, the structure is left to the discretion of the facility and will depend on the facility size and available resources. It is anticipated that hospitals will have an existing PI structure in place. The trauma program PI activities ideally are incorporated into that structure. The description of the PI process contained herein is not meant to be prescriptive, but illustrative. It is understood that facilities will

accomplish PI in a variety of ways. Trauma centers are expected to be able to demonstrate the effectiveness of their program.

The trauma program should have a standing trauma PI team, usually made up of the trauma program manager/coordinator, the trauma services medical director and possibly the trauma program registrar. All information and reports pertaining to trauma program performance are funneled through this team. The data is then either used by the team to address system concerns or referred to one or more PI committees to address patient care concerns.

Both system and patient care-related issues can be identified via several methods.

- Chart abstraction
- Emails
- Hallway conversations
- Hospital information/database systems/registries
- Individual patient charts
- Multidisciplinary committee meetings
- Patient relations inquiries/complaints
- Personal observations
- Rounds
- Staff reports

Reports from staff can be generated via a PI tracking form. (See [Attachment O: Trauma PI Tracking Form.](#))

Morbidity and Mortality Review Committee

The trauma program PI requirements include the establishment of a morbidity and mortality review committee, which is analogous to a physician peer review committee. Its purpose is to provide a review of physician performance. Membership on this committee should be physicians from several disciplines and may include non-physicians (such as nurse practitioners [NPs] or physician assistants [PAs]), at the discretion of the trauma program and hospital administration. The format and activities of this committee are left largely at the discretion of the hospital. Physicians may not review their own care.

The morbidity and mortality review committee should meet regularly and review the facility's trauma care from patient charts, focusing on cases wherein problems, shortcomings, weaknesses or concerns have been identified by the trauma program PI team. If the committee members identify provider-related problems, they should recommend a corrective action plan; if they identify system-related concerns they should forward their findings to the trauma PI team.

This committee is also responsible for reviewing all trauma deaths in the facility to classify them as non-preventable, potentially preventable or preventable. (See [Attachment P: Definitions of Trauma Death Classifications.](#)) If possible, coordination with the local coroner or medical examiner to review the findings of their investigation may prove useful to the facility's M&M Review Committee.

Multidisciplinary Trauma Review

Unlike the morbidity and mortality review committee, membership of the multidisciplinary trauma review committee is not limited to physician providers. The participants in this review are both clinical and non-clinical representatives from all disciplines involved in the care of the trauma patient.

Potential participants may be:

Administrators	Operating room nurses
Department managers	Patient relations personnel
Emergency department nurses	Radiologists
Emergency department providers	Radiologic Technologist
EMS staff	Rehabilitation professionals
Financial management	Risk management staff
Floor nurses	Social services staff
ICU/PACU staff nurses	Surgeons
Laboratory technicians	

The trauma PI team should identify the cases for presentation to this committee. Again, the focus should be on problematic cases or educational opportunities presented by particular cases.

Filters

In addition to system problems and weakness, the team also seeks to identify occurrences of significant events. These events are represented by PI filters. Each filter reflects either an area of patient care that the trauma program would like to scrupulously observe, a standard of care that the facility has established for itself or an ideal expectation of the industry. These are essentially characteristics of system performance or patient care that automatically prompt the process of evaluating that element of the system or care of the patient to determine whether or not it met the standards defined by the industry or the hospital. The primary mechanism in which the trauma program will assess its performance is through the use of these filters.

The examples of filters listed in Table 1 should be perpetually included in the hospital's PI process.

Table 1

Audit filter	Level III	Level IV
Trauma care provided by physicians who do not meet the educational requirement of the plan (e.g., ATLS)	√	√
Trauma transfers	√	√
Trauma deaths	√	√
ED provider non-compliance with on-call response times	√	√
Trauma patients admitted to non-surgeons	√	√
General surgeon non-compliance with on-call response times	√	
Trauma care provided by APRNs, NPs, and PAs		√

It is anticipated that each hospital will also select its own filters to monitor. The filters will change constantly as the facility's need to evaluate various elements of the trauma program changes. Some filters may be watched for six months while others may need to be watched for years before enough cases have been through the hospital and enough data has been collected to effectively assess the system's performance.

Examples of filters commonly used include:

- Abdominal, thoracic or vascular surgery >24 hours after admission
- Absent hourly charting
- C-spine injury missed on initial evaluation
- EMS report not in patient chart
- EMS scene time >10 minutes without extrication involved
- GCS ≤8 left emergency department w/out an airway
- Glasgow Coma Scale ≤8, no endotracheal tube or surgical airway
- Head CT >2 hours after admission with GCS <14
- Laparotomy >1 hour w/ abdominal injuries and systolic blood pressure <90
- Massive blood transfusion (>3 units)
- Non-fixation of femoral diaphyseal fracture in adult
- Open fracture to OR >8 hours after admission
- Over triaged/trauma team activated unnecessarily
- Re-intubated within 24 hours of extubation
- Transferred out; length of stay >2 hours
- Under-triaged/trauma team not activated when criteria met
- Unscheduled return to the OR.

There is no ideal way to quickly and easily identify patients who are characterized by filters. Although some patients will be identified by querying the registry, most will need to be identified by abstracting the information from the patient record manually. The process of abstracting a chart may be assisted by employing the use of a trauma flow sheet to document the resuscitation. (See [Attachment I: Trauma Resuscitation Record](#).) Many performance elements can be easily identified by abstracting this single record. Additionally, filters can be captured with the use of a tracking worksheet (see [Attachment Q: Trauma PI Filter Tracking Worksheet](#)). A worksheet is completed on every major trauma patient by abstracting the chart. If filters are identified, the chart is routed to the trauma PI team for review.

The Performance Improvement Loop

Performance improvement can be thought of as a continuous loop of activity surrounding a given issue. (See [Attachment R: Trauma PI Flowchart](#).)

The three distinct phases of the PI loop are:

- 1) Recognition of the issue;
- 2) Corrective action; and
- 3) Evaluation of the result.

Recognition of the Issue: Enough data must be collected to identify a system or patient care issue. This may be a single occurrence of an event reported by a staff member or PI committee or it may be a recurrence of a similar or same event several times, which is discovered by chart abstraction or by a registry query.

For example: The trauma PI team routinely evaluates all trauma patients transferred. (To identify these patients, they might use the trauma registry to create an ad hoc report.) An expectation established by the hospital is that a trauma patient's condition is accurately assessed, and the patient transferred to definitive care within two hours. The team discovers that 20 percent of these transfers occurred >2 hours after arrival.

The team then reviews the identified cases with the charge of determining why the patients' treatment did not meet the standard of care established by the facility. They may discover that, given the circumstances of the individual patients, the cases were managed as well as they could have been. However, the committee may identify a problem with a protocol, an individual provider or a system policy that contributed to the shortcomings.

As an example:

- The committee discovers that the patients were transferred days after admission to their hometown hospitals after their conditions had stabilized. Therefore, there is no corrective action necessary.
- The committee finds that the transfers were initiated >2 hours after arrival when earlier CTs initially read by emergency department providers were reviewed by radiologists and found to reveal abnormalities requiring transfer to a facility with more resources.

Corrective Action: The problem can now be classified as disease-related, system-related or provider-related and referred, if necessary, to any another appropriate person or committee for review. Corrective action may be unnecessary or may consist of education, protocol revision, practitioner counseling, etc. The team should develop a corrective plan, consulting any in-house and out-of-hospital resources as necessary.

For example, the committee may recommend:

- Implementing a continuing education program for the emergency department providers to improve their CT scan interpretation capabilities.
- Making educational or reference resources available for interpreting CT scans to the emergency department providers.
- Employing the use of an off-site, 24-hour radiology service.

Evaluation of the Result: Once the corrective action is in place, the trauma program again collects data, and the team determines whether or not the action corrected the problem. If it did, the loop is closed, and the issue is resolved. If not, the committee revisits the case and repeats the PI process again.

Trauma Diversion

On rare occasions, critical resources needed to care for seriously injured patients become unavailable at one hospital due to an unusually great demand for those resources, a mechanical plant failure preventing the use of those resources or other event that renders resources unavailable or inaccessible. (More isolated hospitals that are a significant distance from their neighboring hospitals may not be able to safely divert trauma patients simply because of high patient volumes.) In such cases it is important that trauma centers have a contingency plan to divert trauma patients to a nearby facility. (See [Attachment S: Sample Level III Trauma Diversion Protocol](#) and [Attachment T: Sample Level IV Trauma Diversion Protocol](#).)

The decision to divert trauma patients should be carefully considered. It should only occur if, in the judgment of the lead medical staff person, it would be in the patient's best interest to be transported to a different facility rather than attempting to accomplish the resuscitation in an environment lacking critical resources. Trauma center should track both the number of times the

facility goes on divert and the number of patients diverted. (See [Attachment U: Trauma Divert Tracking Log.](#))

Trauma Registry

The collection and use of data is of paramount importance to a successful trauma program: locally, statewide and nationally. A trauma registry is established primarily to ensure quality of care, but it has a secondary benefit of providing data for the surveillance of morbidity and mortality.

Trauma center are required to submit a number of data points to the Kentucky Trauma Data Bank (KTDB) system, and they will be periodically reported to the [National Trauma Database \(NTDB\)](#) system. Additionally, each hospital can design a unique data set to collect and analyze to further their PI objectives. (See [Attachment V: Trauma Registry Inclusion Criteria Examples.](#))

There are several commercial registries available for purchase, but the package considered must be compatible with the NTDB data dictionary, and must be able to transfer required data elements to the Kentucky Trauma Data Bank at least quarterly, as required in 902 KAR Chapter 28. Trauma centers utilizing their own registries must be able to submit data to the state trauma care system without duplicating data entry.

The [Kentucky Injury Prevention Research Center \(KIPRC\)](#), which operates the Kentucky Trauma Data Bank system, will be happy to advise the hospital on packages that are compatible with the system being used by the NTDB and the KTDB.

The function and purpose of the statewide trauma data bank is threefold:

- To facilitate simple and accurate trauma data reporting to the state trauma program.
- To assist trauma center in identifying patients who match their filter characteristics via the report-generating features.
- To collect and report the state required TBI/SCI data, eliminating the need to duplicate data submission.

The state trauma care system can submit your trauma data to the [National Trauma Database \(NTDB\)](#) on your behalf.

Technical assistance for the Kentucky Trauma Data Bank system is available through KIPRC.

Injury Prevention

While the vast majority of a hospital's trauma resources are committed to managing the injured patient, injury prevention cannot be ignored. A trauma hospital's injury prevention program may most effectively be incorporated into existing outreach activities. Ideally, prevention activities will be driven by epidemiological data for the community.

Technical and program assistance for injury prevention can be obtained through the [Kentucky Injury Prevention Research Center \(KIPRC\)](#).

Steps to Implementing a Prevention Activity

Recognize opportunities: Seek out existing public venues for your prevention activities such as school or church fairs and community events such as national night out.

Identify a desired outcome: The goal of the prevention activity may be to reduce the occurrence of a particular injury, raise awareness of a threat or hazard, increase knowledge of a subject or alter behaviors or attitudes.

Identify the target audience: Begin by determining what message you would like to communicate and who the recipients of that message should be. This may be driven by injury data—such as frequency, severity or location of a particular traumatic event within the community—where the audience is specific or by forum opportunity, such as a community fair, where the target audience is diverse.

Develop objectives: Describe the actions necessary to achieve the desired outcomes of the prevention activity. Consider staff and material resources needed, as well as program evaluation tools.

Develop strategies for reaching the targeted audience: Adults, adolescents and children all have different learning styles. By defining the target audience, the curriculum can be customized. For example, characters (such as [Traumaroo™](#)) appeal to children from ages 3 to 7. Children older than 7 relate well to video and slide presentations. Teenagers are most engaged when the forum allows them to voice their own viewpoints and opinions.

Obtain staff and funding for the activity: Do not limit yourself to hospital staff. Often, the goals of other community organizations coordinate well with injury prevention goals of the hospital. Consider the age and cultural dynamics of both the audience and the presenters. Sometimes coordinating the two can improve the effectiveness of the message. Trauma survivors or their family members can be powerful spokespeople. Funding may come from within the facility or from foundations, businesses, civic groups and government agencies.

Evaluate the effectiveness of the activity: Although effectiveness can be assessed by determining the number of people reached or by surveying program participants, ideally, effectiveness should be *measured* by evaluating whether or not the activity actually accomplished the desired outcome. Outcome evaluation should measure progress toward the goal of decreasing injury occurrence or changing the knowledge, attitude or behaviors of the target audience. Techniques may include data collection, surveying and direct observation.

Examples of prevention activities include:

- Bicycle helmet campaigns
- Bicycle rodeos
- Blood pressure screening
- Car seat clinics
- Domestic violence awareness
- Fall prevention
- Firearm safety
- Health fairs
- Intoxicated driving campaigns
- Posters/pamphlet publication
- Red light running campaigns

Required Trauma Center Equipment

The trauma center must have certain equipment capabilities for all ages of trauma patients. See *The American College of Surgeons "Resources for Optimal Care of Inured Patient" manual for Levels I thru III facilities*; and [Attachment W: Level IV Equipment Checklist](#) for a checklist that can be used to verify the existence of the minimum required equipment in your facility. To assist trauma center with emergency care for children, the *American Academy of Pediatrics* has recommended equipment and base medications which are listed in [Attachment X: Recommended Pediatric Equipment Capabilities Checklist](#).

Individualized Consultation

If at any time you have questions about the trauma program and its requirements, contact the KyTAC program.

The KyTAC has committees that focus on key areas of trauma care system development, and would be glad to assist a facility with such things as:

- Application preview
- Assistance establishing or developing a PI or injury prevention program
- Documentation evaluation
- Examples of program policies, forms, tools
- Guidance regarding the existence or establishment of required criteria
- One-on-one consultation/guidance
- Pre-site visit consultation
- Telephone and in-person technical advice
- Web-based registry training

The KyTAC also encourages hospitals in the network "reach out" to partnering hospitals and EMS agencies in their region to provide assistance and technical support. It is part of the requirements for all levels of trauma centers to provide education and assistance to other hospitals and EMS agencies in their referral network. This is hopefully enhanced by working with Health Care Coalitions, or the development of regional trauma coordination committees in the catchment areas of trauma centers at all levels.

The Kentucky trauma program is always eager to hear your feedback. If you have recommendations for resources that can be provided in this manual or elsewhere, please us.

Attachment A: Sample Hospital Board Resolution

WHEREAS, traumatic injury is the leading cause of death for Kentuckians between the ages of 1 and 44 years; and

WHEREAS, [HOSPITAL] strives to provide optimal trauma care; and

WHEREAS, treatment at a trauma hospital that participates in a standardized system of trauma care can significantly increase the chance of survival for victims of serious trauma; and

WHEREAS, participation in the Kentucky Trauma Care System will result in an organized and timely response to patients' needs, a more immediate determination of patients' definitive care requirements, improved patient care through the development of the hospital's performance improvement program and an assurance that those caring for trauma patients are educationally prepared:

THEREFORE; BE IT RESOLVED that the board of directors of [HOSPITAL] resolve to provide the resources necessary to achieve and sustain a level [III or IV] trauma hospital designation.

IN WITNESS THEREOF, I have hereunto subscribed my name this Xst day of (month), 20XX.

Chairman of the Board

Attachment B: Sample Medical Staff Resolution

WHEREAS, traumatic injury is the leading cause of death for Kentuckians between the ages of 1 and 44 years; and

WHEREAS, [HOSPITAL] strives to provide optimal trauma care; and

WHEREAS, treatment at a trauma hospital that participates in a standardized system of trauma care can significantly increase the chance of survival for victims of serious trauma; and

WHEREAS, participation in the Kentucky Trauma Care System will result in an organized and timely response to patients' needs, a more immediate determination of patients' definitive care requirements, improved patient care through the development of the hospital's performance improvement program and an assurance that those caring for trauma patients are educationally prepared:

THEREFORE; BE IT RESOLVED that the medical staff of [HOSPITAL] resolves to support the hospital's trauma program and to provide trauma care commensurate with the standards published by the Kentucky Statewide Trauma Care System for level [X] trauma center.

IN WITNESS THEREOF, I have hereunto subscribed my name this Xst day of (month), 20XX.

Chief of Staff

Attachment C

Sample Trauma Services Medical Director Job Description

Job Title: Trauma Services Medical Director

Reports to: Chief of Medical Staff

Qualifications:

1. Board certified in Family Medicine, Emergency Medicine, Internal Medicine or General Surgery.
2. Member in good standing of the hospital medical staff or emergency medicine staff.
3. Currently licensed to practice medicine in Kentucky.
4. Currently certified in Advanced Trauma Life Support (ATLS).
5. Participated in an ACS Rural Trauma Team Development Course (RTTDC)
6. Three years clinical experience in emergency/trauma care.
7. Two years administrative experience.
8. Ability to establish and maintain effective interpersonal relationships.
9. Ability to accept and implement change.
10. Ability to problem solving make decisions.
11. Demonstrated history of positive collegial relations with colleagues, support staff, hospital-based providers, administrators and patients.

Nature and Scope: The Trauma Services Medical Director is responsible for the ongoing development, growth and oversight/authority of the Trauma Program. He/she must be able to demonstrate effective interpersonal skills and an understanding of the interdependent roles of various allied health professions. The Trauma Services Medical Director is responsible for promoting high standards of practice through development of trauma policies, protocols and practice guidelines; participating in rigorous performance improvement monitoring; resident and staff education and trauma research. He/she has authority to act on all trauma performance improvement and administrative issues and critically review trauma deaths and complications that occur within the hospital. Decisions affecting the care of trauma patients will not be made without the knowledge, input and approval of the Trauma Services Medical Director.

Principal Duties and Responsibilities:

Administration:

- Participate in the research, development and writing of trauma policies, protocols and practice guidelines.
- Implement all trauma program policies and procedures as they pertain to patient care.
- Organize, direct and integrate the trauma program with all other departments and services within the hospital.
- Promote a cooperative and collaborative working environment among the clinical disciplines involved in trauma care.
- Maintain an effective working relationship with the medical staff, trauma service staff, administration and other departments.
- Provide advice and direction in recommending privileges for the trauma service.
- Participate in trauma program marketing activities.

- Establish a physician case management process that fosters cost-effective, high quality patient care.
- Assess need for equipment, supplies, budget
- Assist the Trauma Program Manager in developing and meeting the trauma program budgetary goals.
- Oversee, participate in and develop projects that ensure the cost-effectiveness of care provided by physicians and hospital.

Program Initiatives:

- Lead efforts to develop and maintain a trauma center.
- Collaborate with the Trauma Program Manager to establish trauma program goals and objectives consistent with those of the hospital and ensure that those of the trauma program are being met.
- Develop and provide input on the development and maintenance of practice guidelines, policies and methodologies for medical/surgical trauma care.
- Participate in site review by regulatory agencies.
- Organize, direct and implement departmental practices to assure continued compliance with applicable laws including the guidelines established by the Kentucky Trauma Care System.
- Demonstrate positive interpersonal relationship with colleagues, referral MDs, hospital personnel, and patients/families in order to achieve maximum operational effectiveness and customer satisfaction.
- Assure transfer agreements in place and in good standing; maintain relationship with receiving facilities, foster collaborative relationship.
- Make appropriate referrals for specialty services and communicate regularly with referring physician as appropriate.
- Assume clinical responsibility for all trauma patients.
- Ensure that adequate attending physician availability is provided to render care to trauma patients.
- Ensure the establishment of physician/surgeon call schedules for all trauma care, excluding those who do not meet educational and credentialing requirements.
- Provide trauma care leadership and consultation for emergency, surgery and intensive care unit departments.
- Participate in regional and statewide activities affecting the trauma program.
- Attend local and national meetings and conferences to remain current regarding issues relevant to the performance of duties.
- Demonstrate consistent, efficient, cost effective and quality trauma care at all times.
- Participate in trauma patient/family satisfaction projects as developed by hospital.

Performance Improvement:

- Determine and implement PI activities appropriate to the trauma program.
- Oversee the trauma PI program and participate in other quality initiatives that deal with the care of injured patients.
- Review and investigate all trauma PI inquiries in collaboration with the Trauma Program Manager and refer to the appropriate committees.
- Monitor compliance with trauma treatment guidelines, policies and protocols.
- Assure that the quality and appropriateness of patient care are monitored and evaluated and that appropriate actions based on findings are taken on a consistent basis.

- Report quality of care issues promptly to appropriate individuals, including Trauma Program Manager and hospital administration.
- Identify and correct deficiencies in trauma care policies, guidelines and protocols.
- Consult with appropriate medical staff and administration regarding quality care issues and adverse outcomes; identify areas to improve patient care.
- Assure that continuum of care is maintained.
- Identify representatives from various disciplines appropriate to participate in PI activities.
- Coordinate, schedule and facilitate the PI peer review process.
- Chair the Morbidity and Mortality Committee meeting and the Multidisciplinary Trauma Conference.
- Review all trauma-related peer review and initiate action as necessary.
- Assist the Trauma Program Manager in evaluating the effectiveness of corrective actions resulting from PI processes.
- Assume responsibility for the accuracy and validity of trauma statistics.

Clinical Education:

- Support the requirements for trauma CME by participating and assisting in the education and training of hospital personnel physicians and specialists.
- Provide education for hospital staff regarding trauma program policies and appropriate medical practices.

Community Outreach:

- Maintain relations with community organization and legislative bodies whose activities relate to trauma care and injury prevention
- Participate in hospital outreach activities as may be requested by administration.
- Develop and participate in trauma community education and injury prevention activities.
- Function as a liaison to other hospitals within the region.

Knowledge and Skill:

- Lead the hospital in program development.
- Oversee the clinical practice of medical staff.
- Analyze and interpret complicated information.
- Determines a course of action based on research, data, standards of care and general guidelines/protocols.
- Communicate effectively with a wide variety of intra- and inter-facility staff and administration using both oral and written communication.
- Possess critical thinking, analytical, teaching/coaching and research skills.

Attachment D

Sample Trauma Program Manager/Coordinator Job Description

Job Title: Trauma Program Manager

Reports to: Director of Nursing

Qualifications:

1. Bachelor's degree
2. Currently licensed as a registered nurse in Kentucky.
3. Currently certified in TNCC.
4. Three years clinical experience in trauma/emergency care.
5. Ability to establish and maintain effective interpersonal relationships.
6. Ability to accept and implement change.
7. Ability to problem solve and make decisions.
8. Possession of critical thinking, analytical, teaching/coaching and research skills.

Nature and scope: The Trauma Program Manager (TPM) is responsible for developing, implementing and maintaining a cost-effective system of care for trauma patients and their families throughout the continuum of care. The TPM works both independently and in collaboration with the trauma services medical director and other members of the health care team and the management staff. The TPM is self-directed and self-motivating, plans and conducts work with minimal direction, and reports the progress of work to the director of nursing.

Principal Duties and Responsibilities:

Administration:

- Support and adhere to hospital policies, procedures, philosophy and mission.
- Produce and manage the trauma program budget.
- Interpret and implement policies and procedures; make recommendations for revisions; assist with updating policies and procedures.
- Participate in the development and planning of goals and objectives related to trauma care.
- Coordinate with the trauma services medical director, hospital administration and clinicians to assess the need for policies, procedures and protocols relating to the care of trauma patients.
- Develop policies and procedures based on current literature, input from clinicians and other sources such as information from patient care evaluations.
- Represent the Trauma Program on various hospital and community committees to enhance and foster optimal trauma care management.
- Participate in the budget process: anticipate trends, future needs of the trauma program.
- Work with a broad array of department to resolve inefficiencies and reduce costs
- Supervise adherence to hospital policies and procedures and standards through observation, medical record review, staff feedbacks and other appropriate sources.
- Serves as a liaison to administration, representing the Trauma Program on various hospital and community committees to enhance and foster a fiscally sound Trauma Program.
- Monitor trauma care financial reimbursement issues.

Program Initiatives:

- Implement program initiatives.
- Monitor and maintain compliance with statewide trauma care system regulatory requirements.
- Coordinate preparation for statewide trauma care system designation site visit.
- Develop and foster collaborative relationships with all hospital departments to facilitate and support quality trauma care.
- Participate in state and regional trauma care activities
- Monitor national and statewide trends in trauma care.
- Respond to trauma team activations that occur during work hours; function in whatever role necessary to assist the team in the care of the patient.
- Serve as a resource for the hospital staff regarding trauma care issues.
- Plan and implement strategies for ongoing trauma program development and improvement.
- Monitor state and national trends in trauma care.
- Collaborate with the trauma services medical director, physicians and other health care professionals to provide clinical and system oversight for the care of trauma patients, ensuring the provision of efficient, quality, cost-effective care.

Performance Improvement:

- Assess and improve departmental performance.
- Maintain quality control programs, and participates in the organization's overall quality control program.
- Monitor performance of hospital staff involved with the care of trauma patients.
- Monitor trauma patient outcomes; evaluate for trends.
- Coordinate with physicians, nurses, other in-hospital staff and outside providers to evaluate and address specific patient care issues.
- Participate in case review.
- Assist the trauma services medical director and hospital administration in the development, implementation and evaluation of a quality plan which is multi disciplinary and patient-outcomes focused.
- Serve as the coordinator for the identification, investigation, reporting and follow up of incidents and quality issues throughout the program while maintaining confidentiality.
- Monitor the trauma team's availability and compliance with policies and standards.
- Develop and monitor the trauma PI program in collaboration with the trauma services medical director.
- Coordinate and schedule the morbidity and mortality committee and multidisciplinary review meetings.
- Assist in data collection related to the trauma patient.
- Analyze registry data on the trauma patient population; identify trends for strategic planning and performance improvement.
- Manage registry data: collect, analyze and trend.
- Supervise the collecting, coding, scoring and developing of processes for validation of data entered into the registry.
- Ensure accurate data entry into the trauma registry.
- Ensure the maintenance of the trauma registry in collaboration with the trauma registrar.
- Ensure the periodic reporting of trauma data to the state trauma program.
- Facilitate the measurement of selected outcomes for the trauma patient population.

Clinical Education:

- Plan, coordinate and evaluate trauma-related educational programs for nursing staff.
- Monitor physician and nurse compliance with the educational requirements of the trauma program.
- Ensures staff is involved in the care of trauma patients meet educational requirements of the trauma program.
- Develop, coordinate and implement orientation, nursing education, and in-service programs related to care and management of trauma patients.
- Seek and pursue opportunities for internal and external trauma-related educational programs for hospital staff.

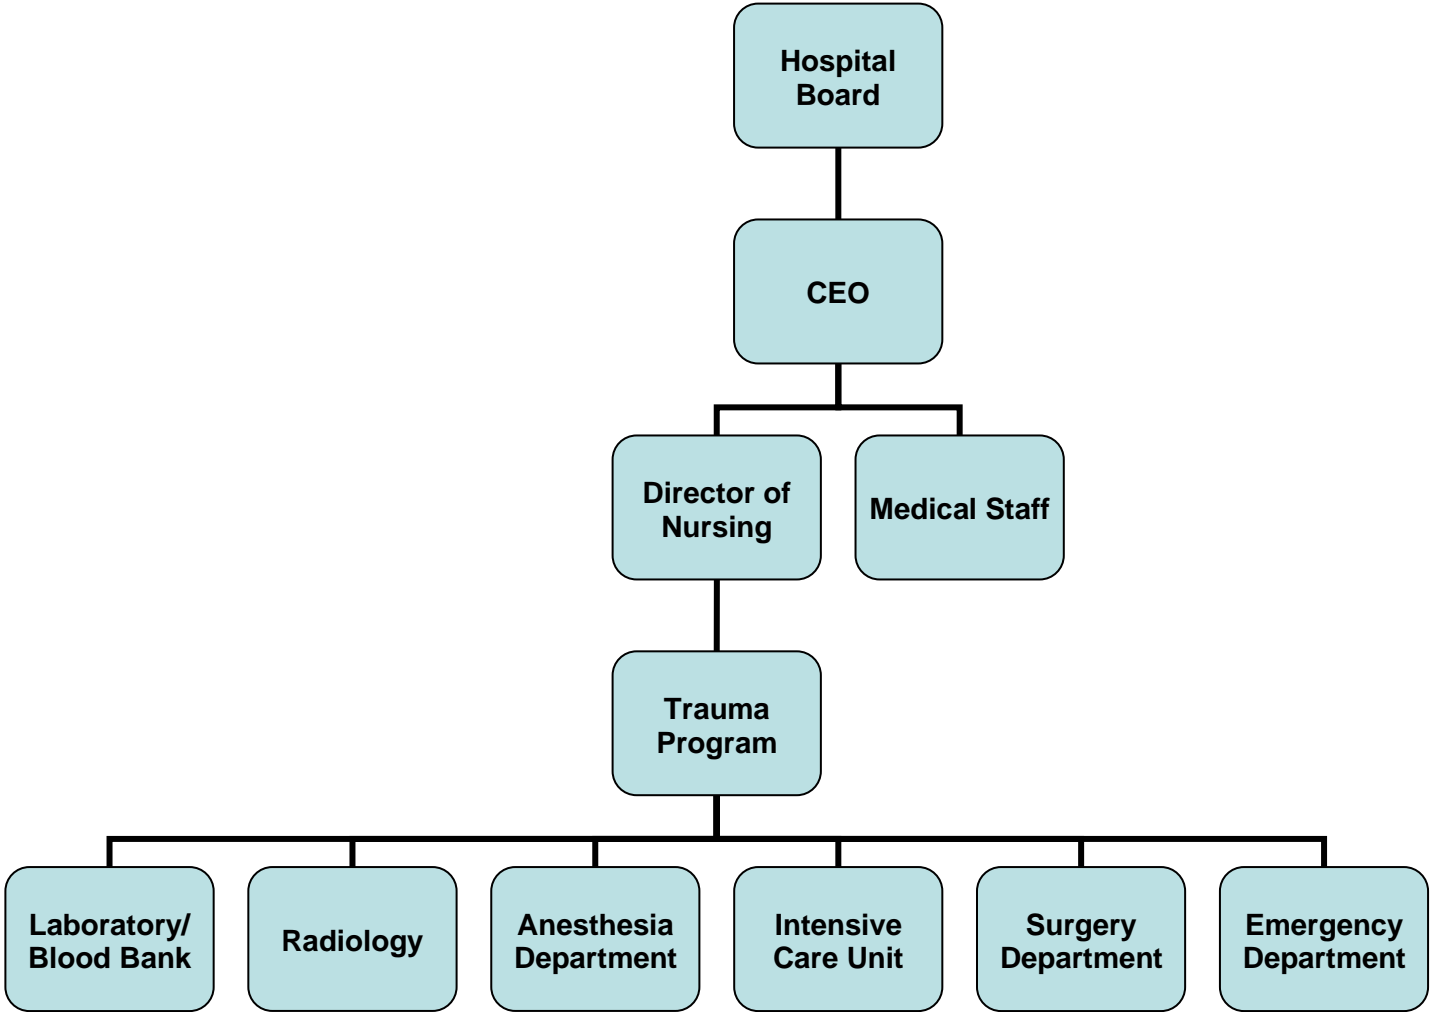

Community Outreach:

- Coordinate and oversee the development and implementation of an injury prevention program.
- Direct community trauma education and prevention programs by developing, implementing and evaluating programs for targeted populations in the community related to injury prevention and other topics identified through needs assessment of the community.
- Develop and implement strategies for communication, education and feedback for EMS systems in the catchment area.
- Identify opportunities for injury prevention programming in the local communities.
- Plan, coordinate and collaborate with community representatives to accomplish injury prevention activities.
- Evaluate the impact of injury prevention activities.
- Seek and pursue opportunities for internal and external trauma-related educational programs for hospital staff, patients, families and the community.

Knowledge and Skill:

- Analyze and interpret complicated information.
- Determine a course of action based on research, data, standards of care and general guidelines/protocols.
- Communicate effectively with a wide variety of intra- and inter-facility staff and administration using both oral and written communication.

Attachment E: Suggested Position of Trauma Program

Attachment F: Sample Single-Tier Trauma Team Activation (TTA) Protocol

Purpose:

A team must be rapidly assembled to provide for the initial evaluation and resuscitation of major trauma patients in an organized and efficient manner.

Policy:

The team is a multi-disciplinary panel of professionals assembled in an organized fashion to perform the tasks necessary to efficiently resuscitate seriously injured patients.

The activation criteria are as follows:

- 1) Activate trauma team upon realization that any of the following patient conditions exists, either upon arrival of the patient or notification by EMS.

Adult or pediatric trauma patient and presenting with:

- Altered level of consciousness: GCS ≤ 13 or less than A on AVPU scale
- Respiratory distress/airway compromise, intubation:
- Shock/diminished perfusion:
 - adult BP <90 , HR >120
 - child

Age	BP	HR
≤ 6	<90	<60 or >160
2-5	<80	<60 or >180
12-24 months	<75	<70 or >180
0-12 months	<70	<80 or >180

- Penetrating wound to the abdomen, neck, or chest
- Severe facial injuries
- Traumatic paralysis
- Severe burns
- Severe orthopedic injuries
- Death in same passenger compartment
- Fall >20 feet
- Ejection from auto
- Physician discretion

Trauma team members:

- 1) Emergency department provider (e.g., physician, nurse practitioner or physician assistant)
- 2) Two emergency department RNs
- 3) Nursing assistant or EMT
- 4) Laboratory technician
- 5) Radiologic Technologist
- 6) Health Unit Coordinator (HUC)

The individual roles of the team members are subject to change based on the needs of the patient and resources available during the resuscitation. Below is a guideline. The provider

leading the resuscitation may modify the duties of any team member if in the best interest of the patient.

Emergency Department Provider:

- Perform primary and secondary survey.
- Perform or delegate airway management.
- Perform procedures as needed such as chest tube insertion, central venous access, ultrasound exam.
- Order appropriate lab and radiographs.
- Responsible for all medications and fluids given.
- Make triage and transfer decisions.
- Determine the need for and mode of inter-facility transfer (air vs. ground) early in resuscitation course.
- Communicate directly with receiving physician at trauma hospital regarding transfer.
- Document case (complete trauma flow sheet, dictate emergency department note).
- Complete and sign patient transfer form.

Emergency Department Nurses

- Prepare trauma room before the patient arrival.
- Place X-ray trauma blocks on the gurney.
- Assist EMS with transfer from EMS gurney to trauma bed.
- Attach BP, cardiac and oximetry monitors to the patient.
- Obtain initial vital signs and report out loud to emergency department provider. (BP, HR, RR, SpO₂ and temp (Core temp if hypothermia is considered)).
- Maintain and monitor all intravenous lines. Obtain fluid resuscitation orders and IV rate from emergency department provider. Report to recorder (at end of emergency department course) total IV intake and urine output.
- Set up fluid and blood warmer. Start blood transfusion as ordered.
- Remain at patient bedside throughout the emergency department course.
- Assist with equipment preparation before the patient arrives.
- Assist with transfer from the EMS gurney to the trauma bed.
- Assist in removing patient's clothing.
- Draw up and label airway drugs (succinylcholine, Etomidate, etc.). Be prepared to administer drugs as ordered by the emergency department provider.
- Obtain IV access if needed. (If primary IV is done, place 2nd IV and draw bloods).
- Inserts Foley catheter when authorized by the emergency department provider.
- Set up chest tube drainage system if needed.
- Assist emergency department provider with procedures as needed.
- Administer tetanus booster and antibiotics when ordered by emergency department provider.
- Initially document emergency department course by filling out the trauma resuscitation record.
- Record vital signs initially and every 5 minutes; make sure that provider in charge is aware of any significant changes in the patient's status.
- Accompany patient out of department for any diagnostic procedures.
- Control traffic in the trauma room; attentive to patient's privacy, e.g., keep curtains closed, keep other patients and family members away from traffic areas.
- Communicate with family.
- Escort family members to trauma room and attend them when appropriate.

Nursing Assistant or EMT

- Assist with transfer from the EMS gurney to the trauma bed.
- Assist in removing patient's clothing; covers patient immediately with warm blankets.
- Assist with intubation: provide in-line cervical spine immobilization or Sellick's maneuver as directed.
- Assist with procedures as needed.
- Assist with transport of patient to X-ray.
- Check airway equipment before the patient's arrival. (i.e., suction, laryngoscopes, ambu bag, O₂)
- Maintain oxygen; insure SpO₂ unit functions properly; assist ventilation with BVM as necessary and as directed by emergency department provider.

Laboratory Technician

- Obtain pre-labeled blood tubes from trauma room; attach ID bracelet to patient.
- Obtain syringes from IV start (by RN) or perform venipuncture to obtain blood for trauma battery.
- Determine availability of blood; bring O negative blood to trauma room immediately if requested.
- Run phase 1 and phase 2 labs, if necessary. (see below)
- Obtain urine from Foley insertion and run UA on all patients. Run urine HCG on all females in reproductive age group.
- Run ABGs.
- Insure type specific blood is available in blood bank.
- Perform ECG if requested.

Radiologic Technologist

- Respond immediately to trauma team activation page; transfer portable x-ray machine to trauma room, insure enough film plates for basic trauma radiographs (e.g., lateral c-spine, chest, pelvis).
- Place chest plate on trauma cart under backboard before patient arrives.
- Determine radiographic priorities per physician in charge.
- Ensure at least 2 additional aprons are in trauma room and available for emergency department staff.
- Develop films and immediately take them to the trauma room.
- Inquire if CT will be needed; call in/notify CT tech to prepare for emergency scan.
- Copy radiographs if patient will be transferred; ensure originals accompany the patient.

Health Unit Coordinator (HUC)

- Activate trauma team upon notification of TTA for the field; confirm all team members have arrived. Record arrival times.
- Determine if additional medical staff will be needed.
- Contact receiving trauma hospital as directed by emergency department provider.
- Assemble and copy all documentation for transport team, e.g., chart, labs, x-ray.
- Direct family members to family support person.
- Prepare patient transfer forms and obtain emergency department provider signature if patient is transferred.
- Request security to secure the helicopter landing pad.
- Meet family members; escort them to the family consultation room.

- Offer to contact others, e.g., family, friends, or clergy.
- Authorize food services to provide refreshments to family members as necessary.
- If the patient is transferred, ensure that family members have transportation and directions to receiving facility.

Procedure:

- a. The emergency department nurse, emergency department provider or EMS becomes aware of a patient meeting TTA criteria and instructs the operator to call a level 1 or 2 TTA. Call a TTA upon receipt of notification that the incoming patient's condition meets the TTA criteria. Do not wait for the patient to arrive in the emergency department before activating the team.
- b. The HUC pages overhead "*Level [1 or 2] Trauma Team Stat, [ETA],*" a total of 3 times.
- c. Team members assemble in the emergency department immediately.
- d. The emergency department provider team leader briefs the team on the condition of the patient and begins to assign duties.
- e. The team leader should immediately consider the need to transfer the patient and activate the trauma transfer protocol, if indicated.

Guiding Principles:

- Transfers should not be delayed to perform laboratory studies. Trauma lab panels, if necessary, should only be performed if they are going to be acted upon locally. Lab studies might include:
 - Heme profile
 - PT/INR
 - PTT
 - Basic metabolic
 - Alcohol
 - Type and screen
 - Arterial blood gases
 - Pregnancy test (serum or urine) on all females in reproductive age group
 - UA
 - Urine tox. screen
- Personal Protective Equipment (PPE) should be worn by all personnel who work directly with the patient.
 - Gowns
 - Gloves
 - Masks to include eye shields
 - Shoe covers, surgical caps
 - Lead aprons
- Keep talking and noise to a minimum. Discuss the patient's condition only behind closed doors and after ensuring a private environment.
- Keep doors and curtains closed. Vigilantly maintain the patient's privacy. Encourage other patients and family members to stay in their cubicles during the resuscitation.
- Ensure that the patient is informed of procedures before they are performed. Continuously ascertain the patient's comfort level (e.g., pain, temperature).
- Verbally acknowledge orders; inform the source when the request has been completed; when giving orders, ensure their receipt.
- Stand in an area removed from the patient until called upon or dismissed, if not directly involved in patient care.

- Select proximal sites for peripheral IVs, when possible; they may need to be converted to rapid infusion catheters.
- Vacate the room when X-rays are being taken unless fitted with a lead apron.
- Place the patient's clothing and belongings into labeled bags as soon as possible.

Attachment G: Sample Multi-Tier Trauma Team Activation (TTA) Protocol

Purpose:

A team must be rapidly assembled to provide for the initial evaluation and resuscitation of major trauma patients in an organized and efficient manner.

Policy:

The team is a multi-disciplinary panel of professionals assembled in an organized fashion to perform the tasks necessary to efficiently resuscitate seriously injured patients.

The activation criteria are as follows:

- 1) Level 1 activation: Activate the Level 1 Trauma Team upon realization that any of the following conditions exist, either upon arrival of the patient or notification by EMS.

Adult or pediatric trauma patient and presenting with:

- Altered level of consciousness: GCS ≤ 8 secondary to trauma or less than V on AVPU scale.
- Respiratory distress/airway compromise, intubation:
 - Adult RR < 10 or > 30
 - Child

Age	RR
≤ 6	< 10 or > 30
2-5	< 10 or > 40
12-24 months	< 10 or > 50
0-12 months	< 10 or > 60

- Shock/diminished perfusion:
 - Adult BP < 90 , HR > 120
 - Child

Age	BP	HR
≤ 6	< 90	< 60 or > 160
2-5	< 80	< 60 or > 180
12-24 months	< 75	< 70 or > 180
0-12 months	< 70	< 80 or > 180

- Severe multiple injuries (two or more systems) or severe single system injury.
- Cardiac or major vessel injuries.
- Transferred patients from other hospitals receiving blood to maintain vital signs.
- Penetrating wound to the abdomen, neck or chest.
- Unstable pelvic fracture.
- Severe facial injuries.
- Physician discretion.

- 2) Level 2 activation: Activate the Level 2 Trauma Team upon realization that any of the following conditions exist, either upon arrival of the patient or notification by EMS.

Adult or pediatric trauma patient and presenting with:

- GCS > 8 and < 14 secondary to trauma.
- Severe burns.

- Cardiac or respiratory disease.
- Co-morbid factors:
 - Insulin-dependent diabetes.
 - Morbid obesity.
 - Age <5 or >55 years.
- Severe orthopedic injuries.
- Injuries with complications (e.g., shock, sepsis, respiratory failure, cardiac failure).
- Traumatic paralysis.
- Death in same passenger compartment.
- Fall >20 feet.
- Ejection from auto.
- Pregnancy >20 weeks.
- Combination trauma with burns.
- Physician discretion.

For each level of activation, the trauma team members are:

1) Level 1 activation

- i) Emergency physician* (present within 15 minutes of patient's arrival)
- ii) General surgeon (present within 30 minutes of patient's arrival)
- iii) Two emergency department RNs*
- iv) Nursing supervisor
- v) Emergency department tech or EMT
- vi) Respiratory therapy
- vii) Anesthesia
- viii) Laboratory technician
- ix) Radiologic Technologist
- x) Emergency department HUC
- xi) Security
- xii) Social services or chaplain

*Note one physician and two RNs per critical patient

2) Level 2 activation

- i) Emergency physician* (present within 15 minutes of patient's arrival)
- ii) Two emergency department RNs*
- iii) Nursing supervisor
- iv) Emergency department tech or EMT
- v) Radiologic Technologist
- vi) Laboratory technician
- vii) Emergency department HUC
- viii) Security

*Note one physician and two RNs per critical patient

The individual roles of the team members are subject to change based on the needs of the patient and resources available during the resuscitation. Below is a guideline. The physician leading the resuscitation may modify the duties of any team member if in the best interest of the patient.

Emergency physician and general surgeon

- Perform primary and secondary survey.
- Perform or delegate airway management.
- Perform procedures as needed such as chest tube insertion, central venous access, ultrasound exam.

- Order appropriate lab and radiographs.
- Responsible for all medications and fluids given.
- Make triage and transfer decisions.
- Determine mode of inter-facility transfer (air vs. ground).
- Communicate directly with receiving physician at trauma hospital regarding transfer.
- Document case (complete trauma flow sheet, dictate emergency department note).
- Complete and sign patient transfer form.
- Coordinate priorities when more than one critical patient in the emergency department.

Emergency Department Nurses

- Prepare trauma room before the patient arrival.
- Place X-ray trauma blocks on the gurney.
- Assist EMS with transfer from EMS gurney to trauma bed.
- Attach BP, cardiac and oximetry monitors to the patient.
- Obtain initial vital signs and report out loud to emergency department physician and critical care nurse. (BP, HR, RR, SpO₂ and temp (core temp if hypothermia is considered)).
- Maintain and monitor all intravenous lines. Obtain fluid resuscitation orders and IV rate from emergency department physician. Report to recorder total IV intake and urine output at end of emergency department course.
- Set up fluid and blood warmer. Start blood transfusion as ordered.
- Remain at patient's bedside throughout the emergency department course.
- Remove patient's clothing.
- Draw up and label airway drugs (succinylcholine, Etomidate, etc.). Be prepared to administer drugs as ordered by the emergency department physician.
- Obtain IV access if needed. (If primary IV is done, place second IV and draw bloods)
- Insert Foley catheter when authorized by the emergency department physician.
- Set up chest tube drainage system if needed.
- Assist physician with procedures as needed.
- Administer tetanus booster and antibiotics when ordered by emergency department physician.
- Initially document emergency department course by filling out the trauma resuscitation record.
- Record vital signs initially and every five minutes; make sure that physician in charge is aware of any significant changes in the patient's status.
- Accompany patient out of department for any diagnostic procedures.
- Accompany patient to ICU, report off to ICU staff.

Nursing Supervisor

- Assess staffing needs; delegate additional nursing staff as required to attend trauma patient or others in the emergency department.
- Ensure all team members are wearing appropriate protective equipment (see below).
- Monitor activities of the trauma team.
- Control traffic in the trauma room; attentive to patient's privacy, e.g., keep curtains closed, keep other patients and family members away from traffic areas.
- Assist others with equipment and procedures as needed.
- Communicate with family in collaboration with family support staff member.
- Escort family members to trauma room and attend them when appropriate.

Emergency Department Technician (or EMT)

- Assist with transfer from the EMS gurney to the trauma bed.
- Assist in removing patient's clothing; cover patient immediately with warm blankets.
- Assist with intubation: provide in line cervical spine immobilization or Sellick's maneuver as directed.
- Assist with procedures as needed.
- Assist with transport of patient to CT scanner.

Respiratory Therapist (When not available a paramedic may take the place of RT.)

- Check airway equipment before the patient's arrival (e.g., suction, laryngoscopes, Ambu bag, O₂).
- Maintain oxygen; ensure SpO₂ unit functions properly; assist ventilation with BVM as necessary and as directed by emergency department physician.
- Assist with intubation; perform Sellick's maneuver after paralytic is given; ensure that in-line cervical spine immobilization is delegated for the intubation.
- Check tube placement after intubation with esophageal detector device, attach end tidal CO₂ monitor and secure ET tube.
- Ventilate patient; set up transport ventilator if necessary.
- Monitor end tidal CO₂ and SpO₂.
- Draw ABGs if requested.

Anesthesia (CRNA or MDA)

- Initially assist with airway management as directed by physician in charge.
- Assist with vascular access (peripheral or central).
- Assist with ventilation if respiratory therapy unavailable (if RT not in house).
- Serve as team leader for an individual patient when emergency department physician unavailable.
- Place NG or OG tube as directed by physician in charge.

Laboratory Technician

- Obtain pre-labeled blood tubes from trauma room; attach ID bracelet to patient.
- Obtain syringes from IV start (by RN) or perform venipuncture to obtain blood for trauma battery.
- Determine availability of blood; bring O negative blood to trauma room immediately if requested.
- Run phase 1 and phase 2 labs (see below).
- Obtain urine from Foley insertion and run UA on all patients. Run urine HCG on all females in reproductive age group.
- Run ABGs.
- Ensure type specific blood is available in blood bank.
- Perform ECG if requested.

Radiologic Technologist

- Respond immediately to trauma team activation page; transfer portable X-ray machine to trauma room, ensure enough film plates for basic trauma radiographs (e.g., lateral c-spine, chest and pelvis).
- Place chest plate on trauma cart under backboard before patient arrives.
- Obtain radiographic priorities from physician in charge.
- Ensure at least two additional aprons are in trauma room and available for emergency department staff.
- Develop films and immediately take them to the trauma room.
- Inquire if CT will be needed; call in/notify CT tech to prepare for emergency scan.

- Copy radiographs if the patient will be transferred; ensure originals accompany the patient.

Health Unit Coordinator (HUC)

- Activate trauma team upon notification of TTA; confirm all team members have arrived and record arrival times.
- Determine if additional medical staff will be needed.
- Contact receiving trauma hospital as directed by emergency department physician.
- Assemble and copy all documentation for transport team, e.g., trauma flow sheet, chart, labs, X-ray.
- Direct family members to family support person.
- Prepare patient transfer forms and obtain emergency department physician signature if patient is transferred.

Security

- Assist with procedures during resuscitation.
- Secure helicopter landing pad and assist flight crew with equipment.
- Assist with transportation of the patient to CT or helipad as needed.

Family Support Person (Social Services, Chaplain or Nursing Supervisor)

- Meet family members; escort them to the family consultation room.
- Offer to contact others, e.g., family, friends or clergy.
- For pediatric resuscitations, accompany parents into the trauma room; attend them continuously.
- Authorize food services to provide refreshments to family members as necessary.
- If the patient is transferred, ensure that family members have transportation and directions to receiving facility.
- In the case of patient's death, assist with contacting funeral service.

Back up physicians (non-emergency department physician called in to assist with multiple casualties)

- Assist with procedures as delegated by the physician in charge.
- Assume responsibility for additional trauma patients or other emergency department patients as directed by physician in charge.
- Inform physician in charge of findings, patient progress; consult regarding treatment/triage/transfer plans.

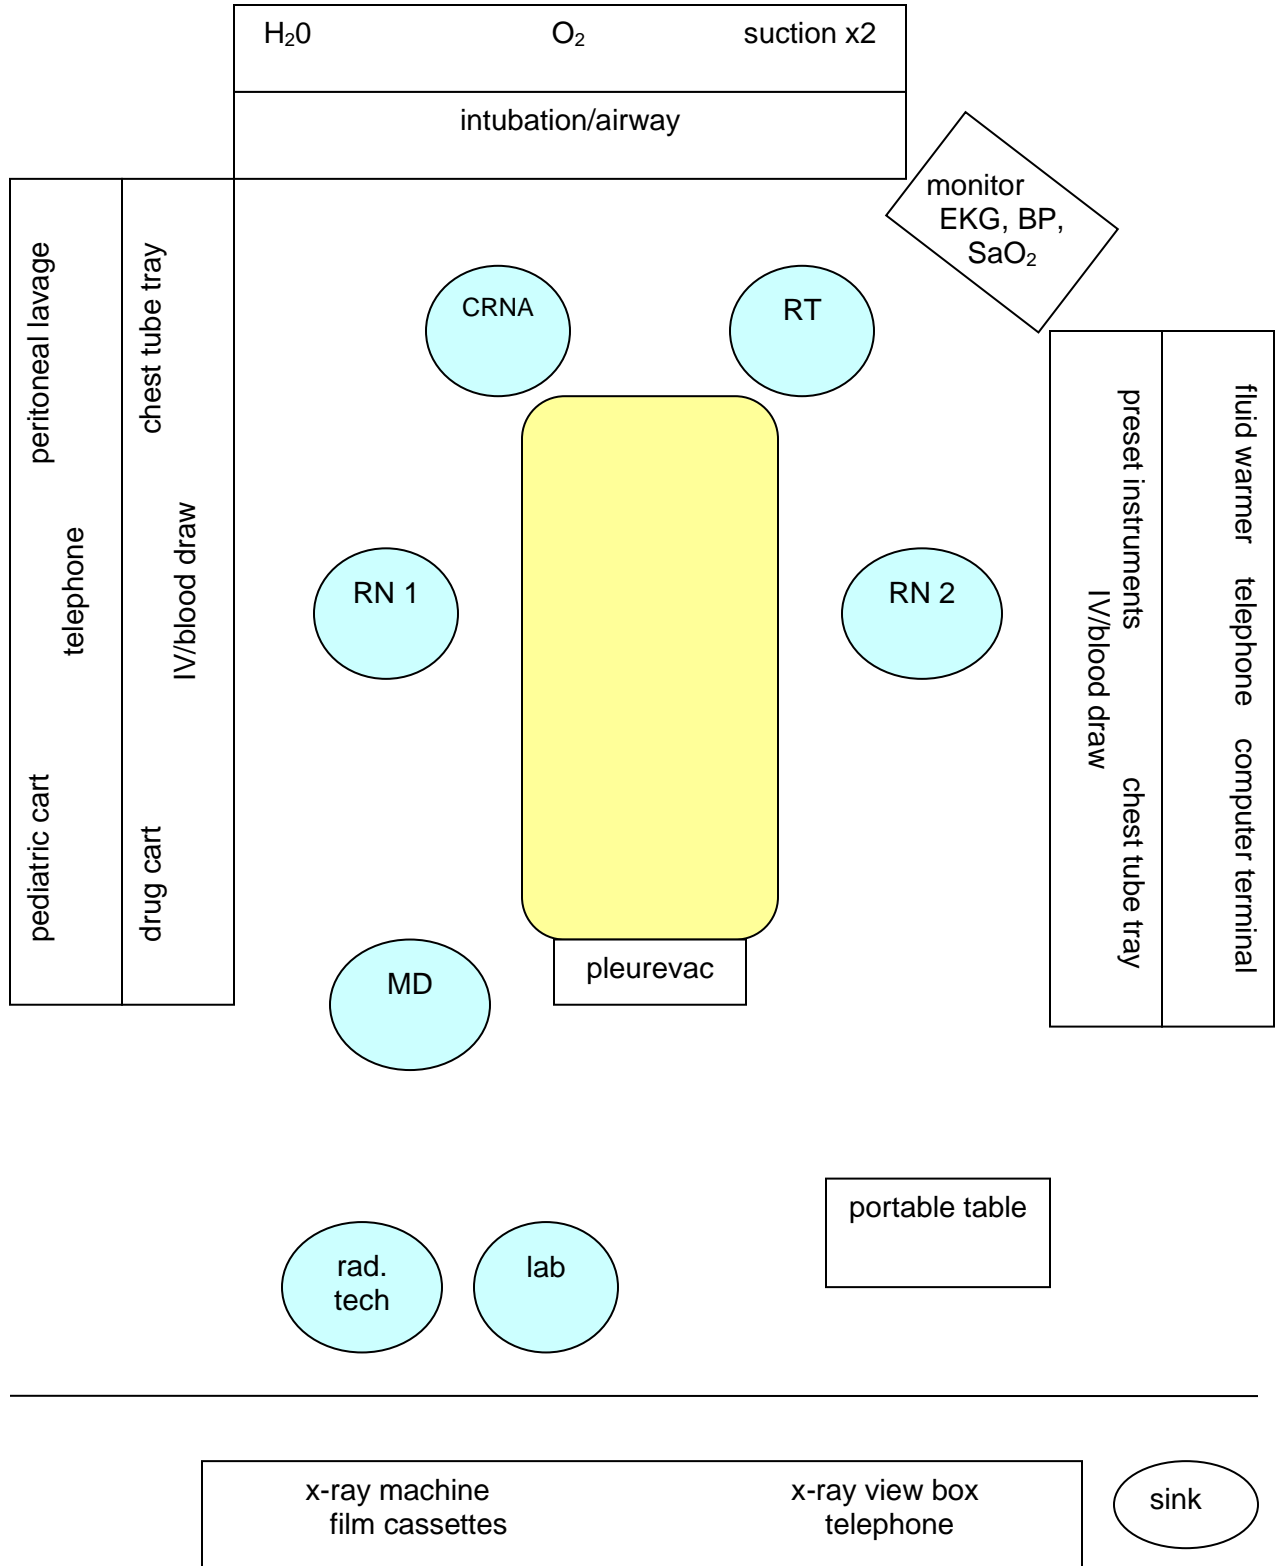

Procedure:

1. The emergency department nurse, emergency department physician or EMS becomes aware of a patient meeting TTA criteria and instructs hospital operator to call a level 1 or 2 TTA. Call a TTA upon receipt of notification that the incoming patient's condition meets the TTA criteria. Do not wait for the patient to arrive in the emergency department before activating the team.
2. The operator pages overhead "Level [1 or 2] Trauma Team Stat, [ETA]," a total of 3 times.
3. Team members assemble in the emergency department immediately.
4. The physician team leader briefs the team on the condition of the patient and begins to assign duties.
5. The physician team leader should immediately consider the need to transfer the patient and activate the trauma transfer protocol, if indicated.

Guiding Principles:

- Transfers should not be delayed to perform laboratory studies. Trauma lab panels, if necessary, should only be performed if they are going to be acted upon locally. Lab studies might include:
 - Heme profile
 - PT/INR
 - PTT
 - Basic metabolic
 - Alcohol
 - Type and screen
 - Arterial blood gases
 - Pregnancy test (serum or urine) on all females in reproductive age group
 - UA
 - Urine tox. screen
- Personal Protective Equipment (PPE) should be worn by all personnel who work directly with the patient.
 - Gowns
 - Gloves
 - Masks to include eye shields
 - Shoe covers, surgical caps
 - Lead aprons
- Keep talking and noise to a minimum. Discuss the patient's condition only behind closed doors and after ensuring a private environment.
- Keep doors and curtains closed. Vigilantly maintain the patient's privacy. Encourage other patients and family members to stay in their cubicles during the resuscitation.
- Ensure that the patient is informed of procedures before they are performed. Continuously ascertain the patient's comfort level (e.g., pain, temperature).
- Verbally acknowledge orders; inform the source when the request has been completed; when giving orders, ensure their receipt.
- Stand in an area removed from the patient until called upon or dismissed, if not directly involved in patient care.
- Select proximal sites for peripheral IVs, when possible; they may need to be converted to rapid infusion catheters.
- Vacate the room when X-rays are being taken unless fitted with a lead apron.
- Place the patient's clothing and belongings into labeled bags as soon as possible.

Attachment H: Sample Trauma Bay Configuration

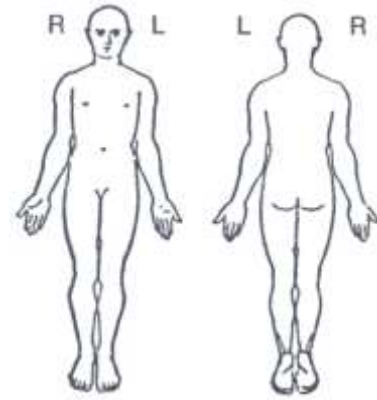

Attachment I: Trauma Resuscitation Record

On the next four pages is a sample form, originally developed for the Minnesota Trauma System, which can be used as an internal model to capture key data elements. It is not required, and is provided only as an example for reference.

Attachment J: Suggested Criteria for Consideration of Transfer

Central Nervous System

- Penetrating injury/open fracture, with or without cerebrospinal fluid leak
- Depressed skull fracture
- GCS <14 or deterioration
- Spinal cord injury or major vertebral injury

Chest

- Major chest wall injury or pulmonary contusion
- Wide mediastinum or other signs suggesting great vessel injury
- Cardiac injury
- Patients who may require prolonged ventilation

Pelvis/Abdomen

- Unstable pelvic ring disruption
- Pelvic fracture with shock or other evidences of continuing hemorrhage
- Open pelvic injury
- Solid organ injury

Major Extremity Injuries

- Fracture/dislocation with loss of distal pulses
- Open long-bone fractures
- Extremity ischemia

Multiple-System Injury

- Head injury combined with face, chest, abdominal, or pelvic injury
- Burns with associated injuries
- Multiple long-bone fractures
- Injury to more than two body regions

Co-morbid Factors

- Age >55 years
- Children \leq 5 years of age
- Cardiac or respiratory disease
- Insulin-dependent diabetes, morbid obesity
- Pregnancy
- Immunosuppression

Secondary Deterioration (Late Sequelae)

- Mechanical ventilation required
- Sepsis
- Single or multiple organ system failure (deterioration in central nervous, cardiac, pulmonary, hepatic, renal, or coagulation systems)
- Major tissue necrosis

American College of Surgeons, *Resources for Optimal Care of the Injured Patient: 1999*, p. 21.

Attachment K: Quick ED Decision Trees

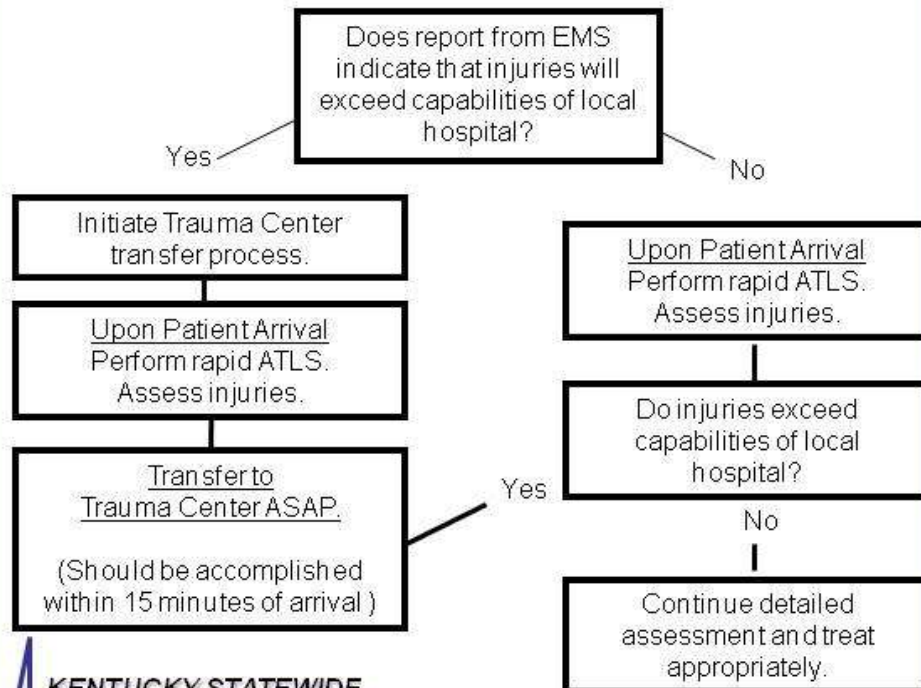

ER Transfer Decision Tree

The goal of the Kentucky Trauma System is to get the right patient to the right place at the right time. Currently in Kentucky the average time between arrival of a trauma victim at a community hospital to arrival at a Level I Trauma Center is _____.

A trauma patient should be transferred to definitive care (usually a surgeon) as soon as possible. Arrangements for transfer should be made as soon as it is recognized that the injuries of the patient exceed the capabilities of the local facility to appropriately treat and care for those injuries.

In the majority of the cases the patient will need rapid ATLS treatment followed by expedient transfer to a designated Trauma Center. There is no need for a complete workup (e.g. CT Scan, multiple x-rays, blood chemistry analysis, etc) prior to transferring the severely injured patient to definitive care.

The decision to transfer a patient should be made within **15 minutes** of arrival

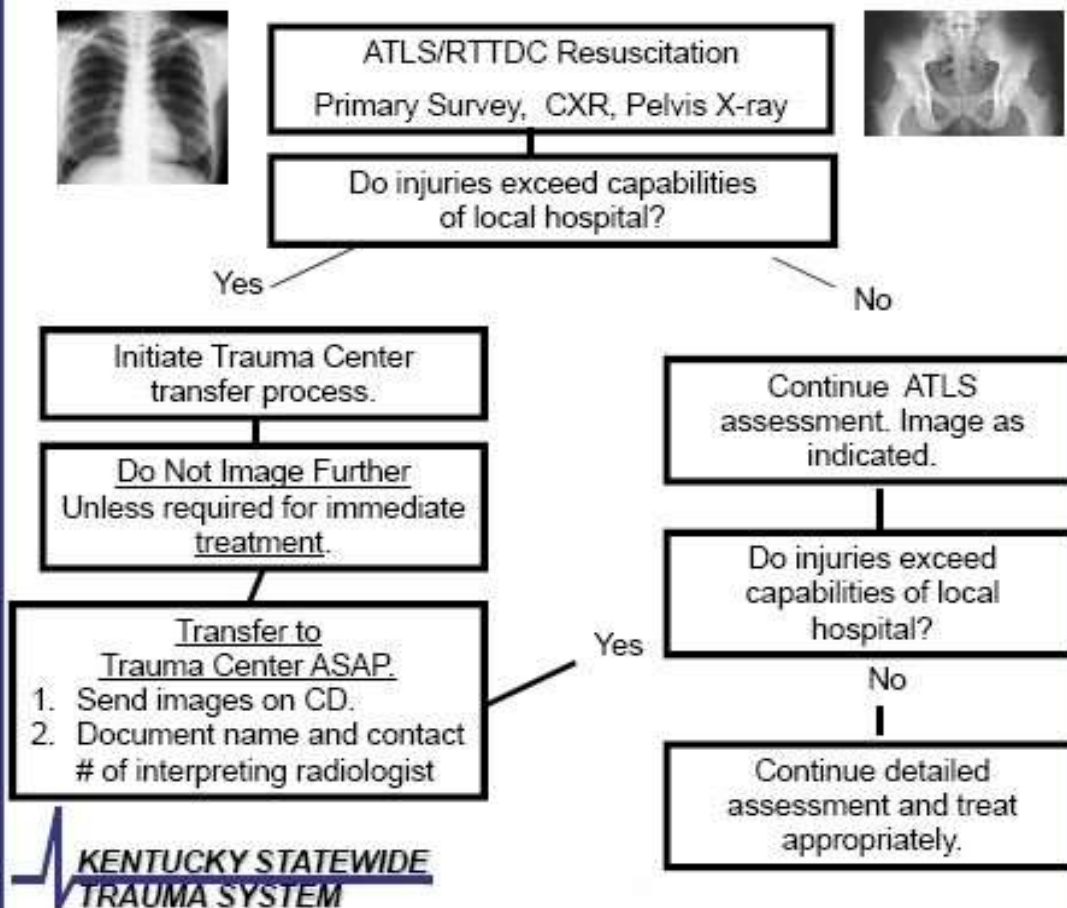

ER Imaging Decision Tree

Victims of trauma have a high rate of repeat imaging after arrival at referral trauma centers. At least 25% of re-imaging can be avoided if optimal quality images are transferred with the patient (*Sung et al. JACR 2009*).

A critically injured trauma patient should be transferred to definitive care (usually a surgeon) as soon as possible and the decision to transfer a patient can often be made within **15 minutes** of arrival. In order to minimize delays in transfer, optimize outcome and minimize unnecessary reimaging of patients, the Kentucky Trauma System recommends the following priorities:

1. Perform only imaging necessary to guide emergency treatment.
2. If patients are transferred, send all imaging on CD (DICOM format) with the patient.
3. Provide name and contact number for the interpreting radiologist so that dialogue between the receiving trauma care providers and the radiologist may occur.

Attachment L: National Guideline for the Field Triage of Injured Patients

RED CRITERIA

High Risk for Serious Injury

Injury Patterns	Mental Status & Vital Signs
<ul style="list-style-type: none"> ▪ Penetrating injuries to head, neck, torso, and proximal extremities ▪ Skull deformity, suspected skull fracture ▪ Suspected spinal injury with new motor or sensory loss ▪ Chest wall instability, deformity, or suspected flail chest ▪ Suspected pelvic fracture ▪ Suspected fracture of two or more proximal long bones ▪ Crushed, degloved, mangled, or pulseless extremity ▪ Amputation proximal to wrist or ankle ▪ Active bleeding requiring a tourniquet or wound packing with continuous pressure 	<p>All Patients</p> <ul style="list-style-type: none"> ▪ Unable to follow commands (motor GCS < 6) ▪ RR < 10 or > 29 breaths/min ▪ Respiratory distress or need for respiratory support ▪ Room-air pulse oximetry < 90% <p>Age 0–9 years</p> <ul style="list-style-type: none"> ▪ SBP < 70mm Hg + (2 x age in years) <p>Age 10–64 years</p> <ul style="list-style-type: none"> ▪ SBP < 90 mmHg or ▪ HR > SBP <p>Age ≥ 65 years</p> <ul style="list-style-type: none"> ▪ SBP < 110 mmHg or ▪ HR > SBP

Patients meeting any one of the above RED criteria should be transported to the highest-level trauma center available within the geographic constraints of the regional trauma system

YELLOW CRITERIA

Moderate Risk for Serious Injury

Mechanism of Injury	EMS Judgment
<ul style="list-style-type: none"> ▪ High-Risk Auto Crash <ul style="list-style-type: none"> - Partial or complete ejection - Significant intrusion (including roof) <ul style="list-style-type: none"> ▪ >12 inches occupant site OR ▪ >18 inches any site OR ▪ Need for extrication for entrapped patient - Death in passenger compartment - Child (age 0–9 years) unrestrained or in unsecured child safety seat - Vehicle telemetry data consistent with severe injury ▪ Rider separated from transport vehicle with significant impact (eg, motorcycle, ATV, horse, etc.) ▪ Pedestrian/bicycle rider thrown, run over, or with significant impact ▪ Fall from height > 10 feet (all ages) 	<p>Consider risk factors, including:</p> <ul style="list-style-type: none"> ▪ Low-level falls in young children (age ≤ 5 years) or older adults (age ≥ 65 years) with significant head impact ▪ Anticoagulant use ▪ Suspicion of child abuse ▪ Special, high-resource healthcare needs ▪ Pregnancy > 20 weeks ▪ Burns in conjunction with trauma ▪ Children should be triaged preferentially to pediatric capable centers <p>If concerned, take to a trauma center</p>

Patients meeting any one of the YELLOW CRITERIA WHO DO NOT MEET RED CRITERIA should be preferentially transported to a trauma center, as available within the geographic constraints of the regional trauma system (need not be the highest-level trauma center)

Attachment M: Sample Trauma Transfer Protocol

Adult and Pediatric Transfer Protocol

Purpose:

Trauma patients who will be transferred out of this facility to a definitive care facility emergently must be identified early, assessed and treated quickly and transferred efficiently in order to provide them the best possible outcome.

Policy:

Patients to be transferred can often be identified before they arrive in the emergency department. Arrangements for emergent transfer can often begin the moment the emergency department staff is notified by EMS that they are en route with a major trauma patient. Other patients may require evaluation by the emergency department physician before the decision to transfer is made.

Once the decision to transfer has been made, it should not be delayed to obtain X rays, CT scans or laboratory results that do not immediately impact the resuscitation. At this point, the focus of the emergency department staff is on resuscitation and stabilization with the goal of minimizing the patient's length of stay in the emergency department.

Consideration should be given to whether the patient will be transferred via ground or air. Generally, seriously injured trauma patients should be transferred by air when possible. Consideration should be given to ground transport if the patient can be received by the definitive care facility sooner than if transported by air or if aero medical transfer is significantly delayed or unavailable for any reason.

Transport vehicles should be staffed by paramedics and/or nurses whenever possible. Trauma patients on whom invasive procedures have been performed or who have received medications must be transferred under the care of personnel who are adequately trained to manage their resulting condition. If necessary, a physician or nurse from this hospital may accompany the patient.

The following are conditions that should immediately activate emergency transfer procedures:

- Physiologic Criteria
 - * Respiratory distress or failure
 - * Children requiring endotracheal intubation and/or ventilatory support
 - * Shock, compensated or uncompensated
 - * Injuries requiring blood transfusion
- Central Nervous System
 - Penetrating injury/open fracture with or without cerebrospinal fluid leak
 - Depressed skull fracture
 - GCS <11 or deteriorating mental status or lateralizing neurological signs
 - Spinal cord injury or major vertebral injury
- Chest
 - Major chest wall injury or pulmonary contusion
 - Wide mediastinum or other signs suggesting great vessel injury
 - Cardiac injury

- Pelvis/Abdomen
 - Pelvic fracture with shock or other evidence of continuing hemorrhage
 - Open pelvic injury
 - Unstable pelvic ring disruption
 - Major abdominal vascular injury
- Major Extremity Injuries
 - Fracture/dislocation with loss of distal pulses
 - * Traumatic amputation with potential for reattachment
- Multiple-System Injury
 - Head injury combined with face, chest, abdominal, or pelvic injury
 - Burns with associated injuries
 - * Other significant penetrating wounds to the neck, thorax, abdomen, or pelvis
 - * Children requiring intensive care
- Secondary Deterioration (Late Sequelae)
 - Single or multiple organ system failure (deterioration in central nervous, cardiac, pulmonary, hepatic, renal, or coagulation systems)
 - Major tissue necrosis

The following conditions should be considered for immediate transfer:

- Central Nervous System
 - GCS >10 and <14
- Chest
 - Patients who may require prolonged ventilation
 - >2 unilateral rib fractures
- Abdomen
 - Solid organ injury
- Major Extremity Injuries or Fractures
 - Open long-bone fractures
 - Extremity ischemia
 - Multiple long-bone fractures
 - * Children with fractures of the axial skeleton
- Multiple-System Injury
 - Injury to more than two body regions
- Co-morbid Factors
 - Age >55 years
 - Children \leq 5 years of age
 - Cardiac or respiratory disease
 - Insulin-dependent diabetes
 - Morbid obesity
 - Pregnancy
 - Immunosuppression
- Secondary Deterioration (Late Sequelae)
 - Mechanical ventilation required
 - Sepsis

Burn Criteria (Thermal or Chemical)

- Electrical injury or burns (including lightning)
- Burns associated with trauma or complicating medical conditions
- Third degree burns of greater than 5% of the body surface area for any age group.

- Contact should be made with a Burn Center for children who meet any of the following criteria:
 - Second and third degree burns of greater than 10% of the body surface area for children less than ten years of age.
 - Second and third degree burns of greater than 20% of the body surface area for children over ten years of age.
 - Burns involving:
 - Signs or symptoms of inhalation injury.
 - Respiratory distress.
 - The face.
 - The ears (serious full-thickness burns or burns involving the ear canal or drums).
 - The mouth and throat.
 - Deep or excessive burns of the hands, feet, genitalia, major joints, or perineum.

Procedure:

Before patient arrival:

1. After becoming aware that a trauma patient is en route who likely will require emergent transfer, the emergency department staff activates the trauma team and notifies the emergency department physician of the likelihood of transfer. Ascertain from EMS if they have already ordered aero medical transportation.
2. The physician identifies the appropriate mode of transfer (i.e., aero medical vs. ground) and qualifications of transferring personnel.
3. Hospital contacts the appropriate aero medical and/or ground transportation, obtains ETA:
 - [INSERT CONTACT INFORMATION]
 - [INSERT CONTACT INFORMATION]
 - [INSERT CONTACT INFORMATION]

After patient arrival:

1. The physician identifies and contacts the receiving facility, and requests the receiving physician to accept the transfer. The two should discuss the current physiological status of the patient and the optimal timing of transfer.
2. Before transfer, the physician should:
 - Ensure chest tubes are placed in the presence of pneumothorax.
 - Ensure at least two IV lines are established.
 - Consider securing the airway with an endotracheal tube, LMA or surgical airway if GCS <11.
 - Consider sending additional blood, equipment and supplies (medications, fluids, etc.) that the patient may need en route if not available in the transporting vehicle.
3. The unit clerk copies all available documentation to accompany the patient:
 - EMS report
 - Resuscitation record
 - X rays, CT scans
 - Lab results

Attachment N: Transfer Agreement Example

Adult and Pediatric Transfer Agreement

This agreement is made and entered into by and between <<Name1 Hospital>> (hereinafter called <<Initials1H>>) and <<Higher Level Regional Medical Center>> (hereinafter called <<Initials RMC>>):

Whereas, both <<INITIALS1H>> and <<INITIALS RMC>> desire, by means of this Agreement, to assist physicians and the parties hereto in the treatment of trauma patients (e.g., burn, traumatic brain injuries, spinal cord injuries, multi-system injuries); and whereas the parties specifically wish to facilitate: (a) the timely transfer of patients and information necessary or useful in the care and treatment of trauma patients transferred, (b) the continuity of the care and treatment appropriate to the needs of adult and pediatric trauma patients, and (c) the utilization of knowledge and other resources of both facilities in a coordinated and cooperative manner to improve the health care of trauma patients.

IT IS, THEREFORE, AGREED by and between the parties as follows:

1. PATIENT TRANSFER: The need for transfer of a patient from <<INITIALS1H>> to <<INITIALS RMC>> shall be determined and recommended by the patient's attending physician in such physician's own medical judgment, based on the triage process for selecting an appropriate trauma center (see Triage document page). When a transfer is recommended as medically appropriate, a trauma patient at <<INITIALS1H>> shall be transferred and admitted to <<INITIALS RMC>> as promptly as possible under the circumstances, provided that beds and other appropriate resources are available. Acceptance of the patient by <<INITIALS RMC>> will be made pursuant to admission policies and procedures of <<INITIALS RMC>>.
2. <<INITIALS1H>> agrees that it shall:
 - a. Notify <<INITIALS RMC>> as far in advance as possible of transfer of a trauma patient.
 - b. Transfer to <<INITIALS RMC>> the personal effects, including money and valuables and information relating to same.
 - c. Make every effort within its resources to stabilize the patient to avoid all immediate threats to life and limbs. If stabilization is not possible, <<INITIALS1H>> shall either establish that the transfer is the result of an informed written request of the patient or his or her surrogate or shall have obtained a written certification from a physician or other qualified medical person in consultation with a physician that the medical benefits expected from the transfer outweigh the increased risk of transfer.
 - d. Affect the transfer to <<INITIALS RMC>> through qualified emergency medical personnel and appropriate transportation equipment to match the patient's acuity level, including the use of necessary and medically appropriate life support measures.
 - e. Obtain informed consent for transfer from the patient, family member, or patient surrogate

3. <<INITIALS1H>> agrees to transmit with each patient at the time of transfer, or in the case of emergency, as promptly as possible thereafter, pertinent medical information and records necessary to continue the patient's treatment, a copy of the informed consent for transfer, and to provide identifying and other information.
4. <<INITIALS RMC>> agrees to state where the patient is to be delivered and agrees to provide information about the type of resources it has available. Facility will provide directions and referral institution information to the family or patient surrogate.
5. Bills incurred with respect to services performed by either party to the Agreement shall be collected by the party rendering such services directly from the patient, third party, and neither party shall have any liability to the other for such charges.
6. This agreement shall be effective from the date of execution and shall continue in effect indefinitely. Either party may terminate this agreement on thirty (30) days notice in writing to the other party. If either party shall have its license to operate revoked by the state, this Agreement shall terminate on the date such revocation becomes effective.
7. Each party to the Agreement shall be responsible for its own acts and omissions and those of their employees and contractors and shall not be responsible for the acts and omission of the other institutions.
8. Nothing in this Agreement shall be construed as limiting the right of either to affiliate or contract with any hospital or nursing home on either a limited or general basis while this Agreement is in effect.
9. Neither party shall use the name of the other in any promotional or advertising material unless review and written approval of the intended use shall first be obtained from the party whose name is to be used.
10. This Agreement shall be governed by the laws of the State of Kentucky. Both parties agree to comply with the Emergency Medical Treatment and Active Labor Act of 1986, and the Health Insurance Portability and Accountability Act of 1996, and the rules now and hereafter promulgated.
11. This Agreement may be modified or amended from time to time by mutual Agreement of the parties, and any such modification or amendment shall be attached to and become part of the Agreement.

<u>Date</u>	<u>Date</u>
<<INITIALS RMC>> Representative	<<INITIALS1H>> President/CEO

Attachment P: Definitions of Trauma Death Classifications

A **non-preventable** death results from an event or complication that is a sequela of a procedure, disease, illness, or injury for which reasonable and appropriate preventable steps have been taken.

For example, a gunshot wound to the head with a Glasgow Coma Scale (GCS) of 3 on arrival and subsequent death, posttraumatic pancreatitis, pneumonia, deep venous thrombosis (DVT), and so on, in patients who had appropriate preventative steps taken. Most deaths and morbidities fall into this category.

A **potentially preventable** death results from an event or complication that is a sequela of a procedure, disease, illness, or injury that has the potential to be prevented or substantially ameliorated.

For example, iatrogenic pneumothorax or wound dehiscence, wherein alternate techniques or judgments may have prevented the complication with some certainty. Such a choice is always a difficult call and requires determination from experienced trauma surgeons or a panel of physicians. An example of a potentially preventable mortality may be an elderly trauma patient with a severe head injury who develops a fatal arrhythmia from electrolyte abnormality. The arrhythmia may have been preventable, but it is unlikely that the death was; therefore, the death is deemed “potentially preventable.” A patient suffering a preventable morbidity who subsequently expires after being declared DNR (do not resuscitate) by family or advanced directive may be determined to be a potentially preventable mortality. There is no precision in these determinations; these are clinical judgments based on the best available evidence.

A **preventable death** results from an event or complication that is an expected or unexpected sequela of a procedure, disease, illness, or injury that could have been prevented or substantially ameliorated.

For example, a patient admitted with abdominal distention and shock who dies from a ruptured spleen two hours later while waiting for a surgeon. Death as a result of a missed epidural hematoma or esophageal intubation may be preventable. Preventable mortalities should be very unusual in a mature trauma care system. A missed fracture resulting from failure to examine the patient may be a preventable morbidity.

Attachment Q: Trauma PI Filter Tracking Worksheet

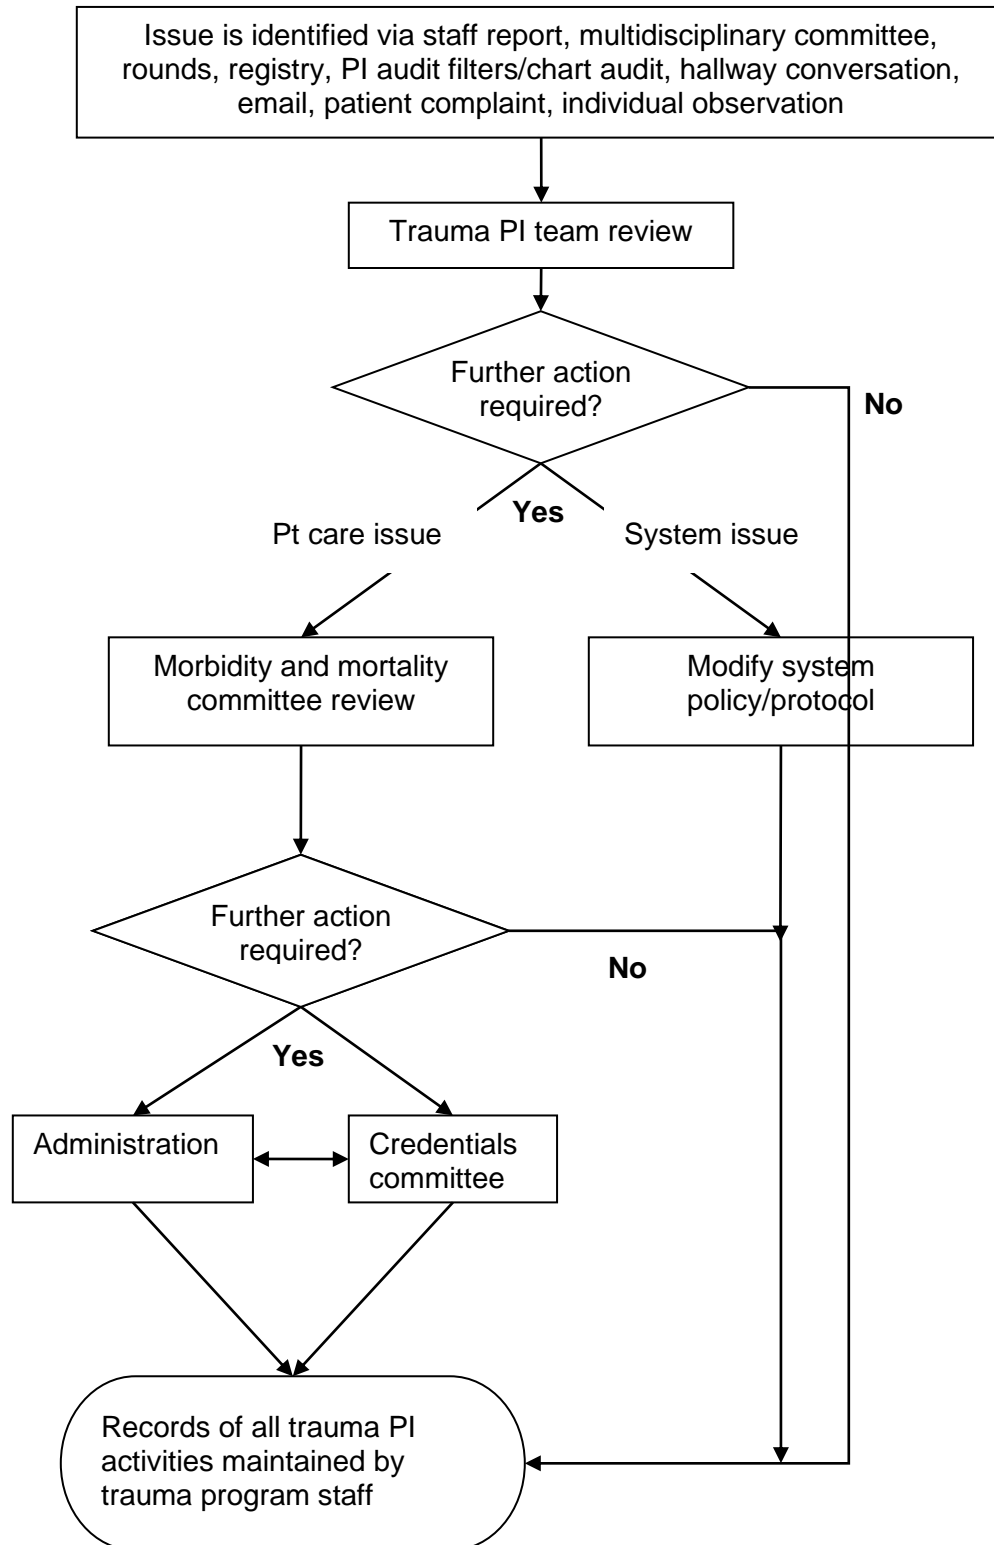

Patient name: _____ Admit date: _____

Medical record #: _____

Data Point	Yes	No	N/A
Trauma care provided by physicians who do not meet the educational requirement (e.g., ATLS)			
Transferred			
Pt died			
General surgeon arrival >30 minutes			
Admitted by non-surgeon			
Care provided by NP or PA			
Re-intubated within 24 hours of extubation			
Surgical debridement of open tibial fracture >8 hours (excluding low velocity gunshot wound)			
Open fracture to OR >8 hours after admission			
Massive blood transfusion (>3 units)			
Unscheduled return to the OR			
Over triaged/trauma team activated unnecessarily			
Under triaged/trauma team not activated when criteria met			
EMS scene time >20 minutes			
C spine injury missed on initial evaluation			
GCS <14 and head CT >2 hours after admission			
EMS report not in patient chart			
GCS ≤8 and no endotracheal tube or surgical airway			
Abdominal injuries, systolic blood pressure <90 and laparotomy >1 hour from arrival			
Abdominal, thoracic or vascular surgery after 24 hours			
Non-fixation of femoral diaphyseal fracture in adult			
Absent hourly charting			
Transfer out after 2 hours in the initial hospital			

Any chart that generated a “Yes” must be reviewed by trauma PI team.

Attachment R: Trauma PI Flowchart

Attachment S: Sample Level III Trauma Diversion Protocol

Purpose:

Occasions may arise when one or more essential hospital resources are functioning at maximum capacity or otherwise unavailable and it is in the best interests of the trauma patient to be directed to an alternative facility for care.

Policy:

The need to go on “trauma divert” is a rare situation but might occur in the following circumstances:

- The emergency department is saturated; demand for critical patient care resources exceeds availability.
- Emergency department resources are fully committed due to an external disaster/multiple-casualty event.
- Emergency department resources are unavailable due to an internal disaster or catastrophic mechanical failure.
- All available trauma surgeons are in the operating room.
- The operating room is functioning at maximum capacity; no surgical suites are expected to become available within one hour.
- General surgeons are overwhelmed with cases.
- The general surgeon is physically unable to operate.

In such rare cases the surgeon in collaboration with the emergency department physician may make the decision to divert trauma patients for a short period of time. The need to remain on divert status should be reviewed at least hourly to provide for the shortest possible time on divert.

The diversion of trauma patients only pertains to incoming ambulance patients and not to walk-in patients. A patient incoming via ambulance while on “trauma divert” will be accepted if the EMS provider and monitoring physician determine that the patient is experiencing a condition such that transport to the next closest appropriate trauma hospital could reasonably result in increased morbidity or death. “Trauma divert” status is a request to EMS personnel to transport the patient to another facility. The patient or EMS personnel may decline the request to divert provided they have been properly apprised of the potential for delayed treatment affecting the care of the patient.

Ambulance patients who have arrived on hospital property will be admitted to the emergency department and evaluated by a physician regardless of the hospital’s diversion status.

Procedure:

Going on divert:

1. The surgeon on call and the emergency department physician will collaborate and decide on the need to go on “trauma divert.” They will notify the emergency department charge nurse.
2. The charge nurse notifies the following of trauma divert status:
 - a. Emergency department nursing staff
 - b. ICU nursing staff

- c. EMS dispatch center(s) (e.g. sheriff departments); request EMS personnel to call hospital early with patient information
- d. [NEIGHBORING HOSPITAL(S)]

3. The emergency department charge nurse begins a “Trauma Divert Tracking Log.”

When contacted by EMS with information regarding a seriously injured trauma patient, the emergency department staff person taking report notifies the EMS crew that the hospital is on trauma divert and immediately puts the crew in contact with the emergency department physician. The physician will determine if the patient is to be seen in the emergency department or diverted to a nearby facility. The decision whether or not to divert must be accomplished very quickly in order to minimize the amount of time the patient spends in transit.

Going off divert:

1. The surgeon and emergency physician who initiated the closure must:
 - a. Continuously evaluate the need to remain on trauma divert.
 - b. Make the decision as to when the hospital is no longer on trauma divert.
 - c. Notify the emergency department charge nurse when no longer on trauma divert.
2. The charge nurse notifies:
 - a. Emergency department nursing staff
 - b. ICU nursing staff
 - c. EMS dispatch center
 - d. [NEIGHBORING HOSPITAL(S)]
3. The emergency department charge nurse completes the “Trauma Divert Tracking Log” and forwards it to the trauma program manager.

Attachment T: Sample Level IV Trauma Diversion Protocol

Purpose:

Occasions may arise when one or more essential hospital resources are functioning at maximum capacity or otherwise unavailable and it is in the best interests of the trauma patient to be directed to an alternative facility for care.

Policy:

The need to go on “trauma divert” is a rare situation but might occur in the following circumstances:

- The emergency department is saturated; demand for critical patient care resources exceeds availability.
- Emergency department resources are fully committed due to an external disaster/multiple-casualty event.
- Emergency department resources are unavailable due to an internal disaster or catastrophic mechanical failure.

In such rare cases, the emergency department physician may make the decision to divert trauma patients for a short period of time. The need to remain on divert status should be reviewed at least hourly to provide for the shortest possible time on divert.

The diversion of trauma patients only pertains to incoming ambulance patients and not to walk-in patients. A patient incoming via ambulance while on “trauma divert” will be accepted if the EMS provider and monitoring physician determine that the patient is experiencing a condition such that transport to the next closest appropriate trauma hospital could reasonably result in increased morbidity or death. “Trauma divert” status is a request to EMS personnel to transport the patient to another facility. The patient or EMS personnel may decline the request to divert provided they have been properly apprised of the potential for delayed treatment affecting the care of the patient.

Ambulance patients who have arrived on hospital property will be admitted to the emergency department and evaluated by a physician regardless of the hospital’s diversion status.

Procedure:

Going on divert:

1. The emergency department physician will decide on the need to go on “trauma divert.” The physician will notify the emergency department charge nurse.
2. The XXX notifies the following of trauma divert status:
 - a. Emergency department nursing staff
 - a. EMS dispatch center(s) (e.g. sheriff departments); request EMS personnel to call hospital early with patient information
 - b. [NEIGHBORING HOSPITAL(S)]
3. The emergency department charge nurse begins a “Trauma Divert Tracking Log.”

When contacted by EMS with information regarding a seriously injured trauma patient, the emergency department staff person taking report notifies the EMS crew that the hospital is on trauma divert and immediately puts the crew in contact with the emergency department physician. The physician will determine if the patient is to be seen in the emergency department

or diverted to a nearby facility. The decision whether or not to divert must be accomplished very quickly in order to minimize the amount of time the patient spends in transit.

Going off divert:

1. The emergency physician who initiated the closure must:
 - a. Continuously evaluate the need to remain on trauma divert.
 - b. Make the decision as to when the hospital is no longer on trauma divert.
 - c. Notify the emergency department charge nurse when no longer on trauma divert.
2. The charge nurse notifies:
 - a. Emergency department nursing staff
 - b. EMS dispatch center
 - c. [NEIGHBORING HOSPITAL(S)]
3. The emergency department charge nurse completes the "Trauma Divert Tracking Log" and forwards it to the trauma program manager.

Attachment V: Trauma Registry Inclusion Criteria Examples

[Note: Given the flexibility of ICD10 coding, these should be considered as examples.]

Does the patient have an ICD-10-CM Code for Injury, poisoning and certain other external causes (S00-T88)

Other examples:

- Retained foreign body (Z18)
- Injuries to the head (S00-S09)
- Injuries to the neck (S10-S19)
- Injuries to the thorax (S20-S29)
- Injuries to the abdomen, lower back, lumbar spine, pelvis and external genitals (S30-S39)
- Injuries to the shoulder and upper arm (S40-S49)
- Injuries to the elbow and forearm (S50-S59)
- Injuries to the wrist, hand and fingers (S60-S69)
- Injuries to the hip and thigh (S70-S79)
- Injuries to the knee and lower leg (S80-S89)
- Injuries to the ankle and foot (S90-S99)
- Injuries involving multiple body regions, burns, frostbite, poisoning, other external causes? (T07 to T88)

Attachment W: Level IV Equipment Checklist

Emergency Department Equipment	Infant	Child	Adult
Airway control and ventilation equipment	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Pulse oximetry	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Supplies for cricothyrotomy	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Supplies for thoracostomy	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Drugs necessary for emergency care	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Nasogastric/oral gastric tubes	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Spinal immobilization equipment	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Pediatric length or weight-based resuscitation tape/charts/equipment (Broselow or Handevy)	<input type="checkbox"/>	<input type="checkbox"/>	
Thermal control for patients and fluids/blood	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Rapid infuser system (e.g., pressure bag)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
End-tidal CO ₂ detector	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Portable X-Ray equipment	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
FAST sonograph	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Communication capability with EMS	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Ability to do patient decontamination if needed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Clinical Laboratory Services

Equipment	Infant	Child	Adult
Standard analysis of blood, urine and other body fluids including micro sampling, when appropriate	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Comprehensive blood bank or access to community blood bank	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Operating Room (if OR services available)

Equipment	Infant	Child	Adult
Thermal control for patients and fluids/blood	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Attachment X: Recommended Pediatric Equipment Checklist

The American Academy of Pediatrics (AAP), the American College of Emergency Physicians (ACEP), and the Emergency Nurses Association (ENA) issued a Joint Policy Statement that was published in the AAP journal Pediatrics, which outlines “Pediatric Readiness in the Emergency Department”. **The Level-IV verification process includes meeting these pediatric readiness requirements.**

In this Policy Statement, they delineate the recommended resources necessary to prepare emergency departments (EDs) to care for pediatric patients. Adoption of the recommendations in this Policy Statement will facilitate the delivery of emergency care for children of all ages and, when appropriate, timely transfer to a facility with specialized pediatric services.

These guidelines are intended to apply to all EDs that provide care for children. In the United States, most children who seek emergency care (83%) present to general EDs versus specialized pediatric EDs. Intended users of these recommendations include all EDs that are open 24 hours per day, 7 days per week, including freestanding EDs and critical access hospital EDs.

What follows on the next four pages is an Emergency Department checklist, updated in 2020, that is based on the joint Policy Statement referenced above. Administrative aspects of the Emergency Department, policy and procedure recommendation areas, recommendations for medications, equipment and supplies, are addressed in the checklist.

Link to the joint Policy Statement:

Downloadable ED checklist:

https://media.emscimprovement.center/documents/NPRP_Checklist_Final_Apr2021_LEqgleE.pdf

Pediatric Readiness in the Emergency Department

This checklist is based on the American Academy of Pediatrics (AAP), American College of Emergency Physicians (ACEP), and Emergency Nurses Association (ENA) 2018 joint policy statement “Pediatric Readiness in the Emergency Department,” which can be found online at: <https://pediatrics.aappublications.org/content/pediatrics/142/5/e20182459.full.pdf>

Use this tool to check if your hospital emergency department (ED) has the most critical components listed in the joint policy statement.

Administration and Coordination of the ED for the Care of Children	ED Policies, Procedures, and Protocols
<p><input type="checkbox"/> Physician Coordinator for Pediatric Emergency Care (PECC)*</p> <ul style="list-style-type: none"> • Board certified/eligible in EM or PEM (preferred but not required for resource limited hospitals) • The Physician PECC is not board certified in EM or PEM but meets the qualifications for credentialing by the hospital as an emergency clinician specialist with special training and experience in the evaluation and management of the critically ill child. <p><input type="checkbox"/> Nurse Coordinator for Pediatric Emergency Care (PECC)*</p> <ul style="list-style-type: none"> • CPEN/CEN (preferred) • Other credentials (e.g., CPN, CCRN) <p>* An Advanced Practice Provider may serve in either of these roles. Please see the guidelines/toolkit for further definition of the role(s).</p>	<p>Policies, procedures, and protocols for the emergency care of children. <i>These policies may be integrated into overall ED policies as long as pediatric-specific issues are addressed.</i></p> <ul style="list-style-type: none"> <input type="checkbox"/> Illness and injury triage <input type="checkbox"/> Pediatric patient assessment and reassessment <input type="checkbox"/> Identification and notification of the responsible provider of abnormal pediatric vital signs <input type="checkbox"/> Immunization assessment and management of the under-immunized patient <input type="checkbox"/> Sedation and analgesia, for procedures including medical imaging <input type="checkbox"/> Consent, including when parent or legal guardian is not immediately available <input type="checkbox"/> Social and behavioral health issues <input type="checkbox"/> Physical or chemical restraint of patients <input type="checkbox"/> Child maltreatment reporting and assessment <input type="checkbox"/> Death of the child in the ED <input type="checkbox"/> Do not resuscitate (DNR) orders <input type="checkbox"/> Children with special health care needs <input type="checkbox"/> Family and guardian presence during all aspects of emergency care, including resuscitation <input type="checkbox"/> Patient, family, guardian, and caregiver education <input type="checkbox"/> Discharge planning and instruction <input type="checkbox"/> Bereavement counseling <input type="checkbox"/> Communication with the patient’s medical home or primary care provider as needed. <input type="checkbox"/> Telehealth and telecommunications
<p>Physicians, Advanced Practice Providers (APPs), Nurses, and Other ED Healthcare Providers</p> <p><input type="checkbox"/> Healthcare providers who staff the ED have periodic pediatric-specific competency evaluations for children of all ages. Areas of pediatric competencies include any/all of the following:</p> <ul style="list-style-type: none"> • Assessment and treatment (e.g., triage) • Medication administration • Device/equipment safety • Critical procedures • Resuscitation • Trauma resuscitation and stabilization • Disaster drills that include children • Patient- and family-centered care • Team training and effective communication 	<p>All-Hazard Disaster Preparedness</p> <p>The written all-hazard disaster-preparedness plan addresses pediatric-specific needs within the core domains including:</p> <ul style="list-style-type: none"> <input type="checkbox"/> Medications, vaccines, equipment, supplies and trained providers for children in disasters <input type="checkbox"/> Pediatric surge capacity for injured and non-injured children <input type="checkbox"/> Decontamination, isolation, and quarantine of families and children of all ages <input type="checkbox"/> Minimization of parent-child separation <input type="checkbox"/> Tracking and reunification for children and families <input type="checkbox"/> Access to specific behavioral health therapies and social services for children <input type="checkbox"/> Disaster drills include a pediatric mass casualty incident at least every two years <input type="checkbox"/> Care of children with special health care needs
<p>Guidelines for QI/PI in the ED</p> <p><input type="checkbox"/> The QI/PI plan includes pediatric-specific indicators</p> <ul style="list-style-type: none"> • Data are collected and analyzed • System changes are implemented based on performance • System performance is monitored over time <p>Please see the guidelines/toolkit for additional details.</p>	

<h3>Evidence-Based Guidelines</h3>	<h3>Guidelines for Medication, Equipment and Supplies</h3>
<input type="checkbox"/> Evidence-based clinical pathways, order sets or decision support available to providers in real time	<p>Pediatric equipment, supplies, and medications are appropriate for children of all ages and sizes (see list below), and are easily accessible, clearly labeled, and logically organized.</p>
<h3>Inter-facility Transfers</h3>	<input type="checkbox"/> ED staff is educated on the location of all items <input type="checkbox"/> Daily method in place to verify the proper location and function of pediatric equipment and supplies <input type="checkbox"/> Medication chart, length-based tape, medical software, or other systems is readily available to ensure proper sizing of resuscitation equipment and proper dosing of medications <input type="checkbox"/> Standardized chart or tool used to estimate weight in kilograms if resuscitation precludes the use of a weight scale (e.g., length-based tape)
<input type="checkbox"/> Written pediatric inter-facility transfer agreements <input type="checkbox"/> Written pediatric inter-facility transfer guidelines. These may include: <ul style="list-style-type: none"> • Criteria for transfers (e.g., specialty services) • Criteria for selection of appropriate transport service • Process for initiation of transfer • Plan for transfer of patient information • Integration of family-centered care • Integration of telehealth/telecommunications 	<h3>Medications</h3>
<h3>Guidelines for Improving Pediatric Patient Safety</h3>	<input type="checkbox"/> Analgesics (oral, intranasal, and parenteral) <input type="checkbox"/> Anesthetics (eutectic mixture of local anesthetics; lidocaine 2.5% and prilocaine 2.5%; lidocaine, epinephrine, and tetracaine; and LMX 4 [4% lidocaine]) <input type="checkbox"/> Anticonvulsants (benzodiazepines, levetiracetam, valproate, carbamazepine, fosphenytoin, and phenobarbital) <input type="checkbox"/> Antidotes (common antidotes should be accessible to the ED, e.g., naloxone) <input type="checkbox"/> Antipyretics (acetaminophen and ibuprofen) <input type="checkbox"/> Antiemetics (ondansetron and prochlorperazine) <input type="checkbox"/> Antihypertensives (labetalol, nicardipine, and sodium nitroprusside) <input type="checkbox"/> Antimicrobials (parenteral and oral) <input type="checkbox"/> Antipsychotics (olanzapine and haloperidol) <input type="checkbox"/> Benzodiazepines (midazolam and lorazepam) <input type="checkbox"/> Bronchodilators <input type="checkbox"/> Calcium chloride and/or calcium gluconate <input type="checkbox"/> Corticosteroids (dexamethasone, methylprednisolone, and hydrocortisone) <input type="checkbox"/> Cardiac medications (adenosine, amiodarone, atropine, procainamide, and lidocaine) <input type="checkbox"/> Hypoglycemic interventions (dextrose, oral glucose) <input type="checkbox"/> Diphenhydramine <input type="checkbox"/> Epinephrine (1mg/mL [1M] and 0.1 mg/mL [IV] solutions) <input type="checkbox"/> Furosemide <input type="checkbox"/> Glucagon <input type="checkbox"/> Insulin <input type="checkbox"/> Magnesium sulfate <input type="checkbox"/> Intracranial hypertension medications (mannitol, 3% hypertonic saline) <input type="checkbox"/> Neuromuscular blockers (rocuronium and succinylcholine) <input type="checkbox"/> Sucrose solutions for pain control in infants <input type="checkbox"/> Sedation medications (midazolam, etomidate and ketamine) <input type="checkbox"/> Sodium bicarbonate (4.2%) <input type="checkbox"/> Vasopressor agents (dopamine, epinephrine and norepinephrine) <input type="checkbox"/> Vaccines (tetanus)
<p>Pediatric patient and medication safety needs are addressed in the following ways:</p> <input type="checkbox"/> Children are weighed in kilograms only <input type="checkbox"/> Weights are recorded in kilograms only <input type="checkbox"/> For children who require emergency stabilization, a standard method for estimating weight in kilograms is used (e.g., a length-based system) <input type="checkbox"/> Infants and children have a full set of vital signs recorded <ul style="list-style-type: none"> • A full set of vital signs includes temperature, heart rate, respiratory rate, pulse oximetry, blood pressure, pain, and mental status when indicated in the medical record <input type="checkbox"/> CO ₂ monitoring for children of all ages <input type="checkbox"/> Process for safe medication delivery that includes: <ul style="list-style-type: none"> • Prescribing • Administration • Disposal <input type="checkbox"/> Pre-calculated drug dosing and formulation guides <input type="checkbox"/> 24/7 access to interpreter services in the ED <input type="checkbox"/> Timely tracking and reporting of patient safety events	
<h3>Guidelines for ED Support Services</h3>	
<input type="checkbox"/> Medical imaging capabilities and protocols address age- or weight-appropriate dose reductions for children <input type="checkbox"/> All efforts made to transfer completed images when a patient is transferred from one facility to another <input type="checkbox"/> Collaboration with radiology, laboratory and other ED support services to ensure the needs of children in the community are met <i>Please see the guidelines/toolkit for additional details</i>	

<p>Equipment/Supplies: General Equipment</p> <ul style="list-style-type: none"> <input type="checkbox"/> Patient warming device (infant warmer) <input type="checkbox"/> IV blood and/or fluid warmer <input type="checkbox"/> Restraint device <input type="checkbox"/> Weight scale, in kilograms only (no opportunity to weigh or report in pounds), for infants and children <input type="checkbox"/> Tool or chart that relies on weight (kilograms) used to assist physicians and nurses in determining equipment size and correct drug dosing (by weight and total volume) <input type="checkbox"/> Pain scale assessment tools that are appropriate for age <input type="checkbox"/> Rigid boards for use in CPR <input type="checkbox"/> Pediatric-specific AED pads 	<p>Equipment/Supplies: Respiratory</p>

**Attachment Y: Kentucky State Trauma Care System
Criteria for State Verification: Level IV Trauma Center**
[Based on 902 KAR 28:030]

Program Component	Description(s)	Specific Criteria
Trauma Program	A trauma program must be created with agreement from the board of directors, administration, and medical staff. The board of directors, administration, medical, nursing, and ancillary staff must make a commitment to provide trauma care at the level for which the facility is seeking verification.	
Trauma Program Medical Director	The trauma services medical director shall be licensed in the Commonwealth of Kentucky, and should be a Board Certified or Board Eligible (BC/BE) physician on staff at the facility, preferably an Emergency Medicine physician. The job description must include his/her roles and responsibilities for trauma care, including trauma team formation, supervision/leadership, and continuing education. The medical director must act as the medical staff liaison to administration, nursing staff, etc. and as the primary contact for that facility with other trauma centers in the region. Required to maintain certification as an ATLS® provider, or Board Certified by ABEM or AOBEM. RTTDC participation is required.	ATLS Current PALS Current ACLS Current RTTDC Recommended
Trauma Program Coordinator/ Manager	A trauma program coordinator or manager is required, and this person should be a Registered Nurse (RN), Advanced Practice Nurse Practitioner (APRN), or a Physician's Assistant (PA), with trauma care experience (ICU, ED, OR) and related credentials. An experienced EMT-Paramedic (EMT-P) with supervisory experience, and extensive EMS or medical flight experience, could be used in this role if necessary. The program manager will work with the trauma services medical director to coordinate and implement the facility's trauma care response. The job description should include time dedicated to the trauma program, separate from other duties the program coordinator/manager may have at the facility. RTTDC participation is recommended.	Trauma Coordinator/ Manager Required
Emergency Department Coverage	There should be 24-hour physician coverage for the emergency department. A mid-level provider (APRN or PA) may serve as the trauma team leader, but a designated ED physician should be available for immediate consultation in the trauma unit when needed during trauma team activations. There must be a designated physician medical director of the ED.	ED Medical Director Required
Emergency Department Physicians	Preferred BC/BE, but not required. ED physicians must maintain current ATLS® Provider certification if not BC/BE by ABEM or AOBEM, and should participate in a RTTDC®, preferably at their practice facility.	ATLS Current PALS Current ACLS Current RTTDC Preferred
Surgical Staff	Orthopedic surgery, plastic surgery, and radiology staff desirable. If staff available, published call schedules are essential. If surgical services will be provided, anesthesia coverage will be essential. 15 hours of annual trauma-related CME for surgeons is required every 3 years. Participating surgical specialties must have one representative attend at least 50% of multi-disciplinary trauma conferences.	

Trauma Nursing Education	Nurses responsible for trauma care at the facility must have completed one of the professional education courses specific to trauma care (Trauma Nursing Core Course TNCC, Advanced Trauma Care for Nurses ATCN, etc). TNCC is the preferred course. APLS, PALS, or ENPC recommended.	TNCC or ATCN Required
Transfer Protocol	The facility must have a written protocol describing the method to rapidly and effectively transfer the trauma patient requiring a higher level of care. The protocol must address: Available ground/air transport services (with contact information), alternative transport services, receiving trauma centers/trauma surgeons contact information, what supplies/records/resources may be utilized to affect the transfer, and specific anatomic and physiologic criteria that if met, will immediately initiate transfer to definitive care. This should ideally be written with involvement of the local ground EMS provider(s) and regional air medical provider(s) to assure seamless patient care during transfer.	
Transfer Agreements	The facility must have a written agreement with a verified Level I, II and/or III trauma center, or appropriate non-verified center that exceeds the capability of a Level-IV trauma center, regarding transfer/care of adult and pediatric trauma patients. Back-up transfer agreement must be obtained specifically for burn patients, in the event the primary regional receiving facility does not have the required capacity. Well defined transfer plans are essential.	Transfer Agreements Required: 1. Level I, II and/or III 2. Burn Care 3. Pediatric Care
Radiology	The facility should have a Radiologic Technologist in-house 24-hours a day for basic plain radiographs used in the evaluation of trauma patients. In the event a technician is not in-house, a 20-minute response time from trauma team activation is required. Response times must be documented and monitored by the trauma program manager. CT and sonography capabilities desirable.	1. Rad Tech <20min for activations 2. CT desired 3. Sonography desired
Clinical Laboratory	The facility must have a Lab Technician available 24-hours a day capable of performing basic studies used in the initial evaluation of trauma patients: CBC, typing, coagulation profile, and ABG. In the event a technician is not in-house, a 20-minute response time from trauma team activation is required. Response times must be documented and monitored by the trauma program manager. Cross-matching is desired but not required. The lab (or blood bank) must have at least two units of O-negative blood available for trauma patients, to be infused at the facility or while en-route to definitive care. There should be a mechanism in place to rapidly access blood/blood products during emergency situations when the lab is not staffed. Micro-sampling is required.	<u>Required:</u> 1. Lab Tech <20min for activations 2. Standard chemistry 3. ABG 4. Hematology 5. Coags 6. Blood typing 7. Blood storage 8. Two units O- PRBC 9. Access to blood from community center <u>Desired</u> 1. Cross-matching
Respiratory Therapy	The facility must have a Respiratory Care Practitioner available 24-hours a day to respond to the ED in the event of a trauma team activation. In the event a Practitioner is not in-house, a 20-minute response time from trauma team activation is required. Other health care personnel (RN, EMT-P) can fulfill this role in the interim provided they have documented internal training and continuing education regarding the use of mechanical ventilation.	Response within 20min of activation required Available 24rs/day desired
Rehab Services	Physical therapy, occupational therapy and social services are desirable but not required.	PT, OT, SW desired.

Trauma Team Activation	<p>The facility must have a trauma team activation protocol that addresses the following:</p> <ul style="list-style-type: none"> • Members of the team and their response requirements once the team has been activated. • Criteria (based on severity, anatomy, and/or physiology of the injury) for trauma team activation and the person(s) authorized to activate the trauma team. • Physician, PA, or APRN must be present at all trauma team activations. 	Presence of the ED physician at trauma activations is required.
Intensive Care Unit	If an ICU is present and trauma patients will be admitted to the ICU, involvement of a surgeon as Director or Co-Director of the ICU is desired.	Surgeon Director/ Co-Director Desired
Performance Improvement	<p>It is required that all trauma centers have an in-house Trauma Registry and submit data to the State Trauma Registry.</p> <p>The facility must have a written policy outlining the performance improvement portion of the trauma program. This must include:</p> <ul style="list-style-type: none"> • Person(s) responsible for performing PI reviews. • Minimum cases to be reviewed: Patients requiring transfer, all trauma deaths, non-compliance of trauma team members to response time requirements, bypasses, transfers, trauma care provided by physicians not meeting minimal education requirements. • Frequency of meetings. • Multidisciplinary physician involvement (Program Director, Radiology, Surgeon if involved). • Attendance minimums for members (50%). • Evidence of loop closure and resolution. <p>The ultimate responsibility for concurrent or retrospective review of trauma patient care lies with the trauma services medical director and program manager.</p> <p>Feedback should be obtained for all transferred patient to Level I, II or III centers.</p>	<p>Required</p> <ol style="list-style-type: none"> 1. PI Program 2. In-house Registry 3. Contribution to state registry 4. Audit of all trauma deaths 5. Morbidity review 6. Multi-disciplinary trauma conference 7. Minimum conference attendance (Emergency Medicine 50%; General Surgery 50%-if involved) 8. Audits of nursing care 9. Audit of pre-hospital trauma care 10. Review of times 11. Review of bypasses 12. Review of transfers 13. Patient care
Morbidity and Mortality Review	A mechanism must be established by which all physicians participating in trauma patient care are involved in a confidential peer review in accordance with medical staff policy. Meetings must regularly review and discuss: Results of peer review activities, problematic cases including complications, and all trauma deaths classified as preventable, potentially preventable, or non-preventable.	M&M Reviews

Trauma Registry	Collect data based on the NTDB (National Trauma Data dictionary) in a trauma registry, and submit data as required by 902 KAR 28:040 to statewide Kentucky Trauma Data Bank.	Trauma Registry Contribution to State Registry
Rural Trauma Team Development Course [®]	The facility should host or participate in a joint RTTDC [®] , as outlined by the American College of Surgeons Committee on Trauma. Participation of physicians, members of administration, nursing, ancillary support staff, and local pre-hospital providers is <u>strongly</u> encouraged.	RTTDC Participation
Outreach Education	Conduct ATLS, TNCC (or equivalent) and ITLS/PHTLS courses as needed. Conduct of regular trauma-related CME for physicians, nurses, pre-hospital and other personnel is desirable.	
Injury Prevention	The facility should participate in injury prevention programs. These may be organized by the facility or in cooperation with law enforcement, fire, EMS, etc. Documentation of activities should be available for review during the verification/re-verification process. Collaboration with other institutions is desired. Monitoring of progress and efficacy of the prevention program(s) is desired.	
Emergency Department Equipment	Refer to Kentucky Trauma Reference Manual, and 902 KAR 28:030.	Equipment
Operating Room	It is desirable (but not required) that an operating room be available for emergency procedures within the scope of practice of the physicians and medical staff. If an operating room is available and the trauma center elects to use that facility for the surgical care of victims of trauma at ANY time, the following are required: <ol style="list-style-type: none"> 1. Operating room staff available within 30 minutes of notification 2. Anesthesia staff within 30 minutes of notification 3. Age specific equipment including: thermal control equipment for patients and fluids/blood products. Also DESIRABLE are endoscopes, bronchoscopes, equipment for long-bone fixation and rapid infusion equipment. 4. If orthopedic procedures are to be performed, C-arm capability is required. 5. Post-anesthetic recovery MUST contain: equipment for monitoring and resuscitation, pulse oximetry, and thermal control 	
Resuscitation Equipment for All Ages	Required resuscitation equipment includes: airway and ventilation, pulse oximetry, suction, ECG, defibrillator, IV administration sets, large bore vascular catheters, cricothyroidotomy, thoracostomy, emergency drugs, Broselow tape, fluid warmer, qualitative CO2 detector, EMS communication equipment Desirable resuscitation equipment includes: venous cutdown, peritoneal lavage, rapid infuser
